Placing
The Chips

Placing the chip(s) on a  comparator involves these steps in the order listed.

25X1

1. Place the chip(s) on the stage of the viewing unit.
2. Using the film clips, clamp the film down.

HIGH-PRECISION-STEREO
COMPARATOR

The High-Precision-Stereo Comparator (HPSC) appears in Figure 5. This device permits stereo viewing of frame, panoramic, and strip stereoscopic photography. For information on the operation and maintenance of this device see the following manuals which are kept in the HPSC remote station --

- 25X1
- * Stereocomparator Operator's Manual, [REDACTED]
 - * [REDACTED] Systems and Stereo Comparator Program Documentation,
Section 4, "Operations," [REDACTED]

HIGH-PRECISION STEREO VIEWER
AND POINT TRANSFER DEVICE

The High-Precision Stereo Viewer and Point Transfer Device (Figure 6) is used to view both spooled film and film chips. The eyepiece assembly permits viewing in a variety of modes, such as stereo, reversed stereo, binocular monoscopic, 180 degrees upright reversion, and superimposed. Details on the operation and maintenance of this device can be found in the Operation and Maintenance Manual for Model 552 High-Precision Stereo Viewer and Point Transfer Device published by [REDACTED]. A copy of this manual can be found in the same remote station as the "Point Transfer Device" you are using.

TO THE USERS

The second edition of the USER'S MANUAL FOR THE REAL-TIME MENSURATION PROGRAM, [] replaces the original manual of the same title, [] which should be destroyed. Whenever necessary, the Real-Time Mensuration Program and the USER'S MANUAL FOR THE REAL-TIME MENSURATION PROGRAM will be modified to accommodate intelligence derived from other camera systems.

This manual explains how to use the Real-Time Mensuration Program and the related equipment. It also contains step-by-step instructions for measuring objects discernible on various kinds of imagery. However, this manual does not contain details on photogrammetric techniques. The subject matter is organized by camera system. Thus, for any given camera system, all available options and the procedures related to each appear in one chapter. However, the Appendix includes a discussion of two output functions, the s-azimuth and the z-azimuth, which were added to the program after copy for CHAPTER II, THE EQUIPMENT, had already been prepared for the printer.

This manual is not to be used with the AID publication, Remote Access Computer Service, third edition, March 1972.

TOP SECRET

25X1

TOP SECRET

25X

CHAPTER I. THE REAL-TIME MENSURATION PROGRAM

PURPOSE AND SCOPE

The Real-Time Mensuration Program (RTMP) calculates accurate measurements of objects discernible on the photography derived from the camera systems used by NPIC. The program can calculate distances, azimuths, geodetic coordinates, heights, and areas of objects visible on the film. In addition to these calculations, the program can create a plot of the objects being measured. The use of this capability is optional.

You use the program from your work area, which is referred to as a remote station. This station consists of at least a teletypewriter and a comparator; it may also include a plotter. All of this equipment is connected to, i.e., on line with, the UNIVAC 494 computer system. This equipment is used to send data to and receive data from that system. In general the RTMP requires that film be mounted on a comparator and identified via teletype messages. The points on which calculations are to be performed are then aligned under the comparator crosshairs and transmitted to the program. Within real time, the results of the calculations are printed via a teletypewriter.

TOP SECRET

25X1

TOP SECRET

25X

MENSURATION PARAMETERS FILE

The Mensuration Parameters File (MPF)* contains ephemeral data and mensuration parameters for KH-4B [] missions. The data for a given mission remains in the MPF for a period of six months. This data can be utilized by the RTMP to identify the characteristics of the photography being used.

25X1

The RTMP will automatically retrieve data from the MPF. If the ephemeral data for the photography being used is in the MPF, the program will search the file and retrieve the necessary parameters. The only parameters that must be input via a teletype will be those unique to the chip or frame being processed.

WHEN TO USE THE PROGRAM

At the present time, the Real-Time Mensuration Program is available weekdays at the times listed below. If these hours are changed, all affected components will be notified.

<u>Monday</u>	<u>Tuesday</u>	<u>Wednesday</u>	<u>Thursday</u>	<u>Friday</u>
0815- 1830	0815- 1830	0815- 1830	0815- 1830	0815- 1830

To use the program outside these hours, complete an Operations Branch Work Request form, IP FM 340 (8/70), and submit it to the Production Analysis Section, Operations Branch, AID, (2N 800) before the program is needed. A sample work request appears on the next page.

* Formerly known as the Attitude and Position Catalog (APC).

CHAPTER II. THE EQUIPMENT

ASR AND KSR TELETYPEWRITERS

Whenever you use the Real-Time Mensuration Program, you will use either an ASR or a KSR Model 35 teletypewriter to

- * transmit to the computer parameters that will identify the film
- * receive calculations produced by the program

TURN-ON PROCEDURES

Before a teletype can be used with the RTMP, it must be turned on. To turn on a teletype follow these procedures.

1. Turn the ON-OFF or MOTOR ON switch to ON.
2. If the teletype has a RYE/REAL TIME toggle switch, move it to the RYE position.
3. If the BREAK light is ON, press and release the BRK-RLS button; if it is not ON, omit this step.

II-1

TOP SECRET

25X1

TOP SECRET

25X

4. Press and release the ALT MODE key.
5. Press and hold the CTRL key.
6. Press and release the Y key.
7. Press and release the G key.
8. Release the CTRL key.

If the computer is functioning properly and this teletype is currently communicating with the RTMP, you will receive this message:

LEN T RTM READY

If this message does not appear, try again later.

If the turn-on sequence listed above were summarized, it could be presented in this manner.

Turn teletype on
Move RYE/REAL TIME (if any) to RYE
Press BRK-RLS (if applicable)
ALT MODE
CTRL (hold)
Y
G

CONVERTING
A TELETYPE

Certain teletypes are used primarily for the RTMP. These teletypes are normally in a technical mode; other teletypes are in an analytic mode. However, teletypes that are normally in a technical mode can also be used in an analytic mode. If your teletype has been used in an analytic mode, you will receive no teletype messages when you try to use the RTMP. If this happens, reconvert the teletype to the technical mode so that it can again be used with the RTMP.

II-2

TOP SECRET

25X1

TOP SECRET

25X1

To do this press these keys:

ALT MODE
CTRL + Y (SVC)
CTRL + G (BELL)

You will receive this message indicating that the conversion is complete:

LEN T RTM READY

This procedure may also be used to effect the conversion:

ALT MODE
CTRL + Y
T+LOGICAL EQUIPMENT NUMBER
(e.g., T112)

You will receive this message when the conversion has been completed:

TLOGICAL EQUIPMENT NUMBER

COMPARATORS

Whenever you use the RTMP, you will use a comparator to

- * locate points of interest on a photograph
- * determine the x and y coordinates of selected points of interest
- * transmit these values to the program

**DUAL-SCREEN
MEASURING PROJECTOR**

The ☐ Dual-Screen Measuring Projector (Figure 1) has two screens upon which images are projected. The large screen is used for scanning; the small screen, for measuring. The ☐ has a main console and an auxiliary console. The main console is used for projecting images; the auxiliary console, for power.

25X1

Parts of
Main Console

The parts of the main console and their respective functions are given in Table 1.

Table 1. ☐ Main Console
Parts and Functions

<u>Part</u>	<u>Function</u>
Y-COORDINATE & X-COORDINATE windows	Display relative coordinates in microns of point under crosshairs on small screen
RESET button	Causes both coordinates to be set at 500,000 counts; does <u>not</u> move film
RETICLE BRILLIANCE switch	Adjusts intensity of reticle to desired illumination
FILM SLEW wheel	Permits film advancement to new frame in either direction
LOW, MEDIUM, & HIGH buttons	Determine speed at which FILM SLEW wheel will advance film

II-5

Table 1. Main Console Parts and
Functions (Continued)

<u>Part</u>	<u>Function</u>
ADVANCE-CLAMP button	In CLAMP position when mensuration is being done; automatically returns to ADVANCE position when FILM SLEW wheel is turned; returns to CLAMP position when FILM SLEW wheel is released
FRAME CENTER button	Causes crosshairs of small screen to be over center of stage; x & y coordinates are changed to accommodate all stage movement
RETICLE wheel	Rotates reticle of small screen
Y DOWN LIMIT & UP LIMIT lights; X LEFT LIMIT & RIGHT LIMIT lights	Indicate stage has reached its movement limit & must be moved in opposite direction
Y wheel	Moves stage toward or away from front of main console
X wheel	Moves optics to right or left
DATA RECORD buttons	Used for transmitting points to program
TRANSMISSION FAILURE light	Indicates failure in transmitting points; must be pressed before additional points can be transmitted
TRANSMISSION light	Indicates point is being sent to program

25X

Turn-On
Procedures

If the ☐ has been turned off for any reason, complete these turn-on procedures. On the auxiliary console,

1. Check the reading of the two meters located in the SERVOMOTOR AMPLIFIER area. Both of the meters must read less than 50 milliamperes.
2. In the CIRCUIT BREAKERS area, move the Servo H.V. and the Vacuum Pump toggle switches to the ON position.
3. In the CURRENT ADJUST area, move the toggle switch to the OPERATING position.

Most of these switches may be left on until the end of a working day. However, you should turn the Vacuum Pump switch off after using the ☐

25X1

Mounting
The Film

To mount film on an ☐ follow these steps in the order listed. At the rear of the main console,

1. Press the ON button.
2. Press the ADVANCE-CLAMP button until the ADVANCE portion lights up.
3. Press the SLEW-LOAD button until the LOAD portion lights up.
4. Mount the film on the stage.
5. Press the SLEW-LOAD button until the SLEW portion lights up.
6. Using the FILM SLEW dial, advance the film to the desired frame.
7. Press the ADVANCE-CLAMP button until the CLAMP portion lights up.
8. Press the ON button; the light will go out.

25X1

[]
[] COMPARATOR

25X1

There are several different models of a [] comparator in []
[] One of these models, 1210, appears in Figure 2. On a [] compara-
tor film is viewed through a binocular optical system. As the light rays
pass through the film, they are magnified and reflected into the eyepieces.
This comparator consists of a main console and an electronic module. The
main console is used for viewing film and determining relative coordinates.
The electronic module is used to display relative x and y coordinates and
to transmit points to the program.

25X1

25X1

Parts of
Comparator

The parts of a [] comparator and their respective functions are
listed in Table 2. All [] comparators [] have these parts.

Turn-On
Procedures

If the ☐ comparator you want to use has been turned off for any reason, complete these turn-on procedures.

On the main console,

1. Move the POWER toggle switch to the ON position.
2. Move the SUBSTAGE switch to the ON position.
3. Wait until the power light on the main console comes on.

On the electronic module,

1. If the electronic module is equipped with a PUNCH/COMPUTER toggle switch, move it to the COMPUTER position.
2. Move the POWER switch to the OFF position.
3. Move the SYSTEM MODE dial to the TWO-AXIS position.

Mounting
The Film

The procedures for mounting film on a ☐ comparator are the following:

25X1

1. Press the FILM PLATEN button. This will activate the electromagnets on the platen and separate the plates of glass.
2. Insert the film between the two plates of glass.

STEREO CHIP COMPARATOR

The [] Stereo Chip Comparator or Chip comparator (Figure 3) permits stereo viewing by means of a binocular optical system and two pieces (chips) of photography. Measurements are performed on only one chip; the other is for viewing only.

The Chip comparator has two principal components: a main console and an electronic module. The main console is used for viewing and determining relative coordinates. The electronic module is used to

- * control the photo environment,
i.e., adjust the lighting, color,
etc.
- * display x and y coordinates
- * transmit points to the program

Parts of
Comparator

The parts of a Chip comparator and their respective functions are listed in Table 3 on the next page.

Compensating
A Comparator

On a chip comparator it is necessary to make adjustments to stabilize the x and y coordinates. This process is known as compensating a comparator. You should compensate a chip comparator every morning before it is used. The procedures for compensating a comparator are the following:

1. Press the X AXIS LEFT drive until movement reaches its limit and the stage stops.
2. Press the Y AXIS IN drive until movement reaches its limit and the stage stops.
3. Zero reset the x and y coordinates.
4. Move the X AXIS AUTO COMPENSATOR toggle switch to the ON position.
5. Press the X AXIS RIGHT drive and allow the stage to move about two inches.
6. Release the X AXIS RIGHT drive and immediately press the X AXIS LEFT drive.
7. When the stage reaches its movement limit, release the X AXIS LEFT drive.
8. Move the X AXIS AUTO COMPENSATOR toggle switch to the OFF position.
9. Move the Y AXIS AUTO COMPENSATOR toggle switch to the ON position.
10. Press the Y AXIS OUT drive and allow the stage to move about two inches.
11. Release the Y AXIS OUT drive and immediately press the Y AXIS IN drive.

II-20

TOP SECRET

25X1

TOP SECRET

12. When the stage reaches its movement limit, release the Y AXIS IN drive.
13. Move the Y AXIS AUTO COMPENSATOR toggle switch to the OFF position.

Placing
The Chips

Placing the chips on a chip comparator involves these steps in the order listed.

1. Place the chip to be measured on the left stage.
2. Move the PUMP toggle switch to the ON position.
3. Move the VAC LEFT toggle switch to the ON position.
4. If you want stereo viewing, place the second chip on the right stage.
5. Move the VAC RIGHT to the ON position.

MICRON
MENSURATION STAGE

The micron Micron Mensuration Stage or comparator Comparator (Figure 4) is a relatively simple device that resembles a microscope. Depending on the optics selected, it can be used for either mono or stereo viewing. The comparator comparator consists of a viewing unit, an electronic module, and a control cabinet. The viewing unit is used for placing and viewing the chip(s). The electronic module records the movement of the film and transmits information to the program. The control cabinet contains the power switches for the device.

25X1

USING THE OUTPUT FUNCTION BUTTONS

Every comparator used with the RTMP has an array of 16 buttons used to determine output. These buttons appear on the main console of an in the area marked INDICATIVE FUNCTIONS. On a Chip, comparator they are located on the transmission panel of the electronic module and are marked INSTRUCTION CHARACTERS. If you are using any of the stereoscopic comparators described earlier, see the instruction manual for the particular comparator you are using.

25X1

25X1

The number of output functions can be increased ten times by using the first rotary switch which is located on the electronic module of all comparators except the HPSC. (See the HPSC instruction manuals located in the HPSC remote station.) Each of the ten settings, 0 through 9, of this rotary switch has the capability of giving an alternate meaning to the array of output function buttons. However, only four settings, 0 through 3, are presently in use. The settings of 0 and 2 are used for monoscopic operations; 1 and 3 for stereoscopic operations. The output functions used most frequently are available for each of the four settings. Figures 9-12 illustrate the output functions available for rotary switch settings 0 through 3.

You must select the correct rotary switch setting and then press the appropriate output function button(s) for the computations you want before you transmit a sequence of points. Several output function buttons may be pressed concurrently to obtain various calculations for one sequence of points. After you receive the output for a given sequence of points, you may release the output function button(s), change the rotary switch setting, and press the appropriate output function button(s) for the next sequence of points. The output function buttons are explained in Table 6.

OBTAINING MENSURAL OUTPUT

How to use the output function buttons and the transmission buttons to obtain mensural output is explained in Table 7.

PLOTTER

A [] plotter (Figure 13) is used with the Real-Time Mensuration Program to obtain a plot of objects discernible on film according to a specified scale and size. It can produce a plot up to 29.5 inches wide.

TURN-ON PROCEDURES

Turning a [] plotter on involves these steps in the order listed.

1. Move the POWER dial to the ON position.
2. Move the CHART DRIVE dial to the ON position.
3. Move the PEN dial to the UP position and then release it.
4. Using the CARRIAGE FAST RUN dial, drive the pen head to the center of the drum.
5. Using the DRUM FAST RUN dial, supply the plotter with adequate paper.

INITIALIZING A PLOTTER

Before a plotter can be used with the RTMP, the photo-plot environment must be established, i.e., initialization must take place. To initialize a [] plotter, press the PLOTTER INITIALIZATION button and then follow these procedures in the order listed.

1. Draw the longest line segment that can be drawn through the area to be plotted.
2. Transmit the approximate center of the area to be plotted as an initial point. You will receive this

II-63

TOP SECRET

25X1

25X1

FIGURE 13. PLOTTER.

25X1

message via the teletype you are using:

ORIGIN SET--SEND FIRST IMAGE LIMIT

3. Transmit one end point of the line drawn as an initial point. You will receive this message:

SEND LAST IMAGE LIMIT

4. Transmit the other end point of the line as an initial point. You will receive this message:

PLOTTER INITIALIZED
SCALE = 1:XXXX

The scale is the scale of the rectified plot to be drawn. It is the ratio between the parameter entered for plot distance and the distance between the image limits on the plotter.

**CHAPTER III. PROCESSING PHOTOGRAPHY FROM THE KH-4A AND KH-4B
CAMERA SYSTEMS**

Using the Real-Time Mensuration Program to process photography derived from the KH-4A and KH-4B camera systems involves these steps in the order listed:

- STEP 1 obtaining parameters
- STEP 2 choosing ellipsoids
- STEP 3 marking fiducials (or measuring grid coordinates)
- STEP 4 initializing a teletype
- STEP 5 submitting parameters
- STEP 6 initializing a comparator
- STEP 7 transmitting points for calculations
- STEP 8 terminating frame operations

There are several options under which KH-4 photography may be processed. The options available are these:

Monoscopic Options

- K4A frame of photography; KH-4A camera system
- K4B frame of photography; KH-4B camera system

III-1

TOP SECRET

25X1

TOP SECRET

25X

K4BR frame of photography; KH-4B camera system;
MPF retrieval

C4A chip of photography; KH-4A camera system

C4B chip of photography; KH-4B camera system

C4BR chip of photography; KH-4B camera system;
MPF retrieval

Stereoscopic Options

SK4A two frames of stereo photography; KH-4A
camera system

SK4B two frames of stereo photography; KH-4B
camera system

SK4BR two frames of stereo photography; KH-4B
camera system; MPF retrieval

SC4A two chips of stereo photography; KH-4A
camera system

SC4B two chips of stereo photography; KH-4B
camera system

SC4BR two chips of stereo photography; KH-4B
camera system; MPF retrieval

When using any of the stereoscopic options, two additional steps are available. They are:

- * transmitting relative orientation (R/O) points to calculate the relative orientation of the two frames or chips of photography
- * switching to the corresponding monoscopic option for either the left or right stage

Both of these steps are optional.

III-2

TOP SECRET

25X1

25X

K4A OPTION

**OBTAINING
PARAMETERS**

You will be responsible for obtaining all parameters needed for each use of the program. Parameters will identify the film being processed, and they will be transmitted via an on-line teletype. If you want the program to produce a plot, you will also need a parameter for plot distance. The use of this capability is optional.

Before using the program, assemble all required parameters. These parameters and their sources are listed in Table 8. Most parameters appear in the Best-Fit Ephemeris for the mission from which the film is derived.

III-3

25X

**MARKING
FIDUCIALS**

Mount the film positive, emulsion side up, on a light table. There will be a small triangular jutting located between the date and the classification on the frame. Fiducial 1 will be the midpoint of the base of the triangle. Mark this point so that you can locate it again later. Fiducial 2 will be an arbitrary point along the format edge in the direction that the titling reads. See Figure 14, which appears at the end of this chapter.

**INITIALIZING
A TELETYPE**

Before you can measure using the Real-Time Mensuration Program, the teletype must be initialized, that is, you must indicate to the program the type of photography to be processed and the camera system that produced the photography. To initialize a teletype follow these instructions in the order given.

Press & release	ALT MODE key
Press	CTRL + U keys (simultaneously)
Type	INIT
Press	RETURN key

You will then receive this message on the teletype:

ENTER SYSTEM NAME

Next,

Type	K4A
Press	RETURN key

III-7

TOP SECRET

25X1

TOP SECRET

25X

You will then receive this message:

LOAD FILM

Load the film positive on the comparator. Procedures for mounting film on a comparator will depend on which comparator you use. These procedures can be found in CHAPTER II, THE EQUIPMENT.

SUBMITTING
PARAMETERS

You will now receive a series of messages requesting parameters. Each message will consist of a request for a specific parameter and the format of that parameter. Characters used in the formats are these:

X = number
Z = letter
S = plus or minus sign
- = dash
. = decimal point

As you receive each message, type the requested parameter in the correct format and then press the RETURN key. You must press the RETURN key after you enter each parameter. For example, when you receive this message:

PROJECT NUMBER XXXXXX

complete the message by typing the correct project number.

PROJECT NUMBER XXXXXX 111050

Then press the RETURN key.

The program provides you with three methods for correcting errors. If you make an error(s) while submitting parameters, follow the appropriate set of instructions.

III-8

TOP SECRET

25X1

TOP SECRET

25X

Correcting Characters

If the last character you typed was erroneous, you can correct it by using the upper case symbol on the N key (†). Press the SHIFT key and the N key simultaneously. Pressing these keys will produce an arrow and delete the preceding character from the transmission. Then type the correct character. The incorrect character will remain on the printed page. For example:

ENTER SYSTEM NAME K4C†A

You can delete up to five consecutive characters. If you have more than one character to correct, press the SHIFT key and the N key to delete each one. Then type the correct characters.

Correcting Lines

If you have made an error in the preceding line, you can delete that line. Simply type DELET and then press the RETURN key. The preceding line, i.e., the parameter and its format, will be reprinted. Type the correct parameter and then press the RETURN key. For example,

ENTER SYSTEM NAME		K4A	
LOAD FILM			
PROJECT NUMBER	XXXXXX	111052	
EMULSION	ZZ	DELET	RETURN key
PROJECT NUMBER	XXXXXX	111050	RETURN key
EMULSION	ZZ		

You may delete as many lines as you wish. If you have more than one line to delete, type DELET and then press the RETURN key for each line. Each time you do this, the program will back up the parameter list one line. After you have deleted the last erroneous line and that parameter and its format have been reprinted, resume typing parameters.

III-9

TOP SECRET

25X1

TOP SECRET

25X1

For example,

ENTER SYSTEM NAME		K4A	
LOAD FILM			
PROJECT NUMBER	XXXXXX	111052	
EMULSION	ZZ	UP	
MISSION	XXXX-X	DELET	RETURN key
EMULSION	ZZ	DELET	RETURN key
PROJECT NUMBER	XXXXXX	111050	RETURN key
EMULSION	ZZ		

Except for the first parameter, i.e., the system name, all parameters may be deleted using this method.

Correcting an Entire Parameter List

If you find that you have made several errors, you can delete the entire parameter list and begin again. To do this, type INIT and then press the RETURN key. The teletype will reprint ENTER SYSTEM NAME. Simply type the parameters again.

Terminating Frame Operations

At any time while you are submitting parameters, you may terminate frame operations. If you decide not to continue processing for any reason, simply type TERM and then press the RETURN key. The teletype will print TERM.

INITIALIZING
A COMPARATOR

After you have submitted all parameters, this message will appear on the teletype you are using:

III-10

TOP SECRET

25X1

TOP SECRET

25X

INITIALIZE VIEWER--SEND FIRST FIDUCIAL

Check the coordinate count on the control panel. The maximum permissible count is 999999. If the count is 900000 or over, reset the counter to 000000.

Before you can use a comparator to obtain dimensional data, it must be initialized, i.e., you must transmit fiducials to the program to establish a coordinate system. Using the X and Y drive and the X and Y wheels, place the comparator crosshairs over fiducial 1. Transmit fiducial 1 to the program by pressing the FIDUCIAL button. You will then receive the coordinates of fiducial 1 via the teletype. You will also receive this message:

SEND NEXT FIDUCIAL

Move the crosshairs about two to four inches to the right along the format edge. This point is fiducial 2. Transmit fiducial 2 by pressing the FIDUCIAL button. You will receive the coordinates of fiducial 2 on the teletype. The direction of flight azimuth and the inertial azimuth will also be printed on the teletype. If they do not agree within a few degrees, there is an error in one of the parameters which was input from the teletype. You should locate the error and determine whether to continue or to start the program again. You will also receive this message:

VIEWER INITIALIZED**TRANSMITTING POINTS
FOR CALCULATIONS**

You are now ready to transmit points to be used for calculations by the Real-Time Mensuration Program. However, if you want the program to produce a plot, you must first initialize the plotter. (See CHAPTER II, INITIALIZING A PLOTTER section.) Then follow the instructions given below for transmitting points for calculations.

1. Turn the first rotary switch to the desired setting.
2. Release any output function buttons that may have been pressed.

III-11

TOP SECRET

25X1

**TOP SECRET**

25X1

3. Press the appropriate output function buttons for the calculations you want.
4. Position the comparator crosshairs over each point you want to transmit. Transmit each of these points to the program by pressing the appropriate transmission button.

Mensural calculations will be printed on the teletype. If you have elected to have the program produce a plot, you will also receive that on the  plotter.

TERMINATING FRAME OPERATIONS

After all measurements have been calculated, operations for the frame being processed must be terminated by pressing the FIDUCIAL button. Place the comparator crosshairs over fiducial 1. Press the FIDUCIAL button to begin the termination of frame operations. You will then receive this message on the teletype:

FIRST TERMINAL FID RECEIVED

Measurements can continue to be calculated until you press the FIDUCIAL button twice in succession. When you press the FIDUCIAL button a second time, you will receive this message:

FRAME OPERATIONS TERMINATED DATE TIME
POINTING COUNT = XX FILM DRIFT = XX.XX MICRONS

The pointing count is the total number of points transmitted including fiducials. Film drift is the distance the film has moved at fiducial 1 from the time fiducials 1 and 2 were first transmitted until frame operations were terminated. Extensive film drift may result in inaccurate mensural calculations.

**TOP SECRET****MARKING
FIDUCIALS**

Mount the film positive, emulsion side up, on a light table. Note the series of small white spots (rail holes) along the top of the frame. There will be two irregularities to this series of rail holes:

- * binary block
a small group of dots, some slightly raised
from the rail holes line; indicates vehicle
clock time
- * center of format
a pair of rail holes directly over the frame
center

The Panoramic Geometry Stripe (PG Stripe) is a narrow white line on the frame's border about 0.01 inches from the format edge. Extend a line joining the two rail holes which are over the center of format until it intersects the inside edge of the PG Stripe. This intersection will be fiducial 1. With a pinpoint or by some other method, mark fiducial 1 so that it can be located again later. Fiducial 2 will be on the PG Stripe toward the titling of the frame. See Figure 15, which appears at the end of this chapter.

**INITIALIZING
A TELETYPE**

Before you can measure using the Real-Time Mensuration Program, the teletype must be initialized, that is, you must indicate to the program the type of photography to be processed and the camera system that produced that photography. To initialize a teletype follow these instructions in the order given.

Press & release

ALT MODE key

Press

CTRL + U keys (simultaneously)

TOP SECRET

TOP SECRET

25X1

Type INIT
Press RETURN key

You will then receive this message on the teletype:

ENTER SYSTEM NAME

Next,

Type K4B
Press RETURN key

You will then receive this message:

LOAD FILM

Load the film positive on a comparator. Procedures for mounting film on a comparator will depend on which comparator you use. These procedures can be found in CHAPTER II, THE EQUIPMENT.

**SUBMITTING
PARAMETERS**

You will now receive a series of messages requesting parameters. Each message will consist of a request for a specific parameter and the format of that parameter. Characters used in the formats are these:

X = number
Z = letter
S = plus or minus sign
- = dash
. = decimal point

III-20

TOP SECRET

25X1

TOP SECRET

25X

As you receive each message, type the requested parameter in the correct format and then press the RETURN key. You must press the RETURN key after you enter each parameter. For example, when you receive this message

PROJECT NUMBER XXXXXX

complete the message by typing the correct project number.

PROJECT NUMBER XXXXXX 111105

Then press the RETURN key.

The program provides you with three methods for correcting errors. If you make an error(s) while submitting parameters, follow the appropriate set of instructions.

Correcting Characters

If the last character you typed was erroneous, you can correct it by using the upper case symbol on the N key (†). Press the SHIFT key and the N key simultaneously. Pressing these keys will produce an arrow and delete the preceding character from the transmission. Then type the correct character. The incorrect character will remain on the printed page. For example:

ENTER SYSTEM NAME K4C†B

You can delete up to five consecutive characters. If you have more than one character to correct, press the SHIFT key and the N key to delete each one. Then type the correct characters.

III-21

TOP SECRET

25X1

TOP SECRET

25X1

Correcting Lines

If you have made an error in the preceding line, you can delete that line. Simply type DELET and then press the RETURN key. The preceding line, i.e., the parameter and its format, will be reprinted. Type the correct parameter and then press the RETURN key. For example,

ENTER SYSTEM NAME		K4B	
LOAD FILM			
PROJECT NUMBER	XXXXXX	111052	
EMULSION	ZZ	DELET	RETURN key
PROJECT NUMBER	XXXXXX	111050	RETURN key
EMULSION	ZZ		

You may delete as many lines as you wish. If you have more than one line to delete, type DELET and then press the RETURN key for each line. Each time you do this, the program will back up the parameter list one line. After you have deleted the last erroneous line and that parameter and its format have been reprinted, resume typing parameters.

For example,

ENTER SYSTEM NAME		K4B	
LOAD FILM			
PROJECT NUMBER	XXXXXX	111052	
EMULSION	ZZ	UP	
MISSION	XXXX-X	DELET	RETURN key
EMULSION	ZZ	DELET	RETURN key
PROJECT NUMBER	XXXXXX	111050	RETURN key
EMULSION	ZZ		

Except for the first parameter, i.e., the system name, all parameters may be deleted using this method.

TOP SECRET

TOP SECRET

25X

Correcting an Entire
Parameter List

If you find that you have made several errors, you can delete the entire parameter list and begin again. To do this, type INIT and then press the RETURN key. The teletype will reprint ENTER SYSTEM NAME. Simply type the parameters again.

Terminating Frame
Operations

At any time while you are submitting parameters, you may terminate frame operations. If you decide not to continue processing for any reason, simply type TERM and then press the RETURN key. The teletype will print TERM.

INITIALIZING
A COMPARATOR

After you have submitted all parameters, this message will appear on the teletype you are using:

INITIALIZE VIEWER--SEND FIRST FIDUCIAL

Check the coordinate count on the control panel. The maximum permissible count is 999999. If the count is 9000000 or over, reset the counter to 000000.

Before you can use a comparator to obtain dimensional data, it must be initialized, i.e., you must transmit fiducials to the program to establish a coordinate system. Using the X and Y drive and the X and Y wheels, place the comparator crosshairs over fiducial 1. Transmit fiducial 1 to the program by pressing the FIDUCIAL button. You will then receive the coordinates of fiducial 1. You will also receive this message:

SEND NEXT FIDUCIAL

III-23

TOP SECRET

25X1

TOP SECRET

25X

Move the crosshairs about two to four inches to the right along the PG Stripe. This point is fiducial 2. Transmit fiducial 2 by pressing the FIDUCIAL button. You will receive the coordinates of fiducial 2 on the teletype. The direction of flight azimuth and the inertial azimuth will also be printed on the teletype. If they do not agree within a few degrees, there is an error in one of the parameters which was input from the teletype. You should locate the error and determine whether to continue or to start the program again. You will also receive this message:

VIEWER INITIALIZED

TRANSMITTING POINTS
FOR CALCULATIONS

You are now ready to transmit points to be used for calculations by the Real-Time Mensuration Program. However, if you want the program to produce a plot, you must first initialize the plotter. (See CHAPTER II, INITIALIZING A PLOTTER section.) Then follow the instructions given below for transmitting points for calculations.

1. Turn the first rotary switch to the desired setting.
2. Release any output function buttons that may have been pressed.
3. Press the appropriate output function buttons for the calculations you want.
4. Position the comparator crosshairs over each point you want to transmit. Transmit each of these points to the program by pressing the appropriate transmission button.

Mensural calculations will be printed on the teletype. If you have elected to have the program produce a plot, you will also receive that on the plotter.

III-24

TOP SECRET

25X1

TOP SECRET

25X

**TERMINATING FRAME
OPERATIONS**

After all measurements have been calculated, operations for the frame being processed must be terminated by pressing the FIDUCIAL button. Place the comparator crosshairs over fiducial 1. Press the FIDUCIAL button to begin the termination of frame operations. You will then receive this message on the teletype:

FIRST TERMINAL FID RECEIVED

Measurements can continue to be calculated until you press the FIDUCIAL button twice in succession. When you press the FIDUCIAL button a second time, you will receive this message:

FRAME OPERATIONS TERMINATED	DATE	TIME
POINTING COUNT = XX	FILM DRIFT = XX.XX MICRONS	

The pointing count is the total number of points transmitted including fiducials. Film drift is the distance the film has moved at fiducial 1 from the time fiducials 1 and 2 were first transmitted until frame operations were terminated. Extensive film drift may result in inaccurate mensural calculations.

CHOOSING
ELLIPSOIDS

When evaluating film you will indicate the earth ellipsoid which best fits the target area. Choose the best fitting ellipsoid out of the six presently available and enter the mnemonic for that ellipsoid as a parameter. The six ellipsoids, their mnemonics, and their measurements including the eccentricity squared (E^2) of each ellipsoid are given below.

<u>Ellipsoid</u>	<u>Mnemonic</u>	<u>Measurement</u>
Mission Correlation Data or Mission Performance Report	MCD	Semi-major axis--- 6378177.8 m. Semi-minor axis--- 6356796.05 m. E^2 ----- .006693422
Krassovsky	KVY	Semi-major axis--- 6378245.0 m. Semi-minor axis--- 6356863.0188 m. E^2 ----- .006693422
International	INT	Semi-major axis--- 6378388.0 m. Semi-minor axis--- 6356911.9961 m. E^2 ----- .006722670
Clarke 1866	CRK	Semi-major axis--- 6378206.4 m. Semi-minor axis--- 6356583.8 m. E^2 ----- .006768658

25X1

**TOP SECRET**

25X

**MEASURING GRID
COORDINATES**

Mount the film positive, emulsion side up, on a light table. There will be a small triangular jutting located between the date and the classification on the frame; this is the center fiducial. To measure the grid coordinates, place a Universal Grid Number 2 over or under the frame so that the grid numbers read correctly. Position the grid so that

- * the triangle above the X = 46 line covers the center fiducial, and
- * the small dash lines at Y = 14.8 are along the top format edge of the frame

These two conditions should be met as closely as possible. However, because of film deformation, absolute congruency is not always feasible. With a pinpoint or by some other method, mark the end points of the longest line segment (usually diagonal) that can be drawn through the target area. These points must fall on grid intersections. Record the grid coordinates of each of the two end points and note the order in which you recorded them. Cut the chip from the frame.

**INITIALIZING
A TELETYPE**

Before you can measure using the Real-Time Mensuration Program, the teletype must be initialized, that is, you must indicate to the program the type of photography to be processed and the camera system that produced the photography. To initialize a teletype follow these instructions in the order given.

Press & release	ALT MODE key
Press	CTRL + U keys (simultaneously)
Type	INIT
Press	RETURN key

III-43

TOP SECRET

25X1

TOP SECRET

25X

You will then receive this message on the teletype:

ENTER SYSTEM NAME

Next,

Type	C4A
Press	RETURN key

You will then receive this message:

LOAD CHIP

Load the film positive on the comparator. Procedures for placing the chips can be found in CHAPTER II, THE EQUIPMENT.

SUBMITTING
PARAMETERS

You will now receive a series of messages requesting parameters. Each message will consist of a request for a specific parameter and the format of that parameter. Characters used in the formats are these:

X = number
Z = letter
S = plus or minus sign
- = dash
. = decimal point

As you receive each message, type the requested parameter in the correct format and then press the RETURN key. You must press the RETURN key after you enter each parameter. For example, when you receive this message

PROJECT NUMBER XXXXXX

III-44

TOP SECRET

25X1

TOP SECRET

25X

complete the message by typing the correct project number.

PROJECT NUMBER XXXXXX 111050

Then press the RETURN key.

The program provides you with three methods for correcting errors. If you make an error(s) while submitting parameters, follow the appropriate set of instructions.

Correcting Characters

If the last character you typed was erroneous, you can correct it by using the upper case symbol on the N key (↑). Press the SHIFT key and the N key simultaneously. Pressing these keys will produce an arrow and delete the preceding character from the transmission. Then type the correct character. The incorrect character will remain on the printed page. For example:

ENTER SYSTEM NAME C4C↑A

You can delete up to five consecutive characters. If you have more than one character to correct, press the SHIFT key and the N key to delete each one. Then type the correct characters.

Correcting Lines

If you have made an error in the preceding line, you can delete that line. Simple type DELET and then press the RETURN key. The preceding line, i.e., the parameter and its format, will be reprinted. Type the correct parameter and then press the RETURN key. For example,

III-45

TOP SECRET

25X1

TOP SECRET

25X

ENTER SYSTEM NAME		C4A	
LOAD FILM			
PROJECT NUMBER	XXXXXX	111052	
EMULSION	ZZ	DELET	RETURN key
PROJECT NUMBER	XXXXXX	111050	RETURN key
EMULSION	ZZ		

You may delete as many lines as you wish. If you have more than one line to delete, type DELET and then press the RETURN key for each line. Each time you do this, the program will back up the parameter list one line. After you have deleted the last erroneous line and that parameter and its format have been reprinted, resume typing parameters.

For example,

ENTER SYSTEM NAME		C4A	
LOAD FILM			
PROJECT NUMBER	XXXXXX	111052	
EMULSION	ZZ	UP	
MISSION	XXXX-X	DELET	RETURN key
EMULSION	ZZ	DELET	RETURN key
PROJECT NUMBER	XXXXXX	111050	RETURN key
EMULSION	ZZ		

Except for the first parameter, i.e., the system name, all parameters may be deleted using this method.

Correcting an Entire Parameter List

If you find that you have made several errors, you can delete the entire parameter list and begin again. To do this, type INIT and then press the RETURN key. The teletype will reprint ENTER SYSTEM NAME. Simply type the parameters again.

III-46

TOP SECRET

25X1

TOP SECRET

25X

Terminating Frame
Operations

At any time while you are submitting parameters, you may terminate frame operations. If you decide not to continue processing for any reason, simply type TERM and then press the RETURN key. The teletype will print TERM.

INITIALIZING A
COMPARATOR

After you have submitted all parameters, this message will appear on the teletype you are using:

INITIALIZE VIEWER--SEND FIRST FIDUCIAL

Check the coordinate count on the control panel. The maximum permissible count is 999999. If the count is 999999 or over, reset the counter to 000000.

Before you can use a comparator to obtain dimensional data, it must be initialized, i.e., you must transmit the grid points to the program to establish a coordinate system. Using the X and Y drive and the X and Y wheels, place the comparator crosshairs over the point entered as the first grid. Transmit this point to the program by pressing the FIDUCIAL button. You will then receive the coordinates of this grid point on the teletype. You will also receive this message:

SEND NEXT FIDUCIAL

Position the crosshairs over the point entered as the second grid. Transmit this point to the program by pressing the FIDUCIAL button. You will receive the coordinates of this grid point. The direction of flight azimuth and the inertial azimuth will also be printed on the teletype. If they do not agree within a few degrees, there is an error in one of the parameters which was

III-47

TOP SECRET

25X1

TOP SECRET

25X

input from the teletype. You should locate the error and determine whether to continue or to start the program again. You will also receive this message:

VIEWER INITIALIZED

TRANSMITTING POINTS
FOR CALCULATIONS

You are now ready to transmit points to be used for calculations by the Real-Time Mensuration Program. However, if you want the program to produce a plot, you must first initialize the plotter. (See CHAPTER II, INITIALIZING A PLOTTER section.) Then follow the instructions given below for transmitting points for calculations.

1. Turn the first rotary switch to the desired setting.
2. Release any output function buttons that may have been pressed.
3. Press the appropriate output function buttons for the calculations you want.
4. Position the comparator crosshairs over each point you want to transmit. Transmit each of these points to the program by pressing the appropriate transmission button.

Mensural calculations will be printed on the teletype. If you have elected to have the program produce a plot, you will also receive that on the plotter.

TERMINATING FRAME
OPERATIONS

After all measurements have been calculated, operations for the frame being processed must be terminated by pressing the FIDUCIAL button. Place

III-48

TOP SECRET

25X1

TOP SECRET

25X

the comparator crosshairs over the first grid point. Press the FIDUCIAL button to begin the termination of frame operations. You will then receive this message on the teletype:

FIRST TERMINAL FID RECEIVED

Measurements can continue to be calculated until you press the FIDUCIAL button twice in succession. When you press the FIDUCIAL button a second time, you will receive this message:

FRAME OPERATIONS TERMINATED DATE TIME
POINTING COUNT = XX FILM DRIFT = XX.XX MICRONS

The pointing count is the total number of points transmitted including grid points. Film drift is the distance the film has moved at the first grid point from the time the grid points were first transmitted until frame operations were terminated. Extensive film drift may result in inaccurate mensural calculations.

**CHOOSING
ELLIPSOIDS**

When evaluating film you will indicate the earth ellipsoid which best fits the target area. Choose the best fitting ellipsoid out of the six presently available and enter the mnemonic for that ellipsoid as a parameter. The six ellipsoids, their mnemonics, and their measurements including the eccentricity squared (E^2) of each ellipsoid are given below.

<u>Ellipsoid</u>	<u>Mnemonic</u>	<u>Measurement</u>
Mission Correlation Data or Mission Performance Report	MCD	Semi-major axis--- 6378177.8 m. Semi-minor axis--- 6356796.05 m. E^2 ----- .006693422
Krassovsky	KVY	Semi-major axis--- 6378245.0 m. Semi-minor axis--- 6356863.0188 m. E^2 ----- .006693422
International	INT	Semi-major axis--- 6378388.0 m. Semi-minor axis--- 6356911.9961 m. E^2 ----- .006722670
Clarke 1866	CRK	Semi-major axis--- 6378206.4 m. Semi-minor axis--- 6356583.8 m. E^2 ----- .006768658
Bessel	BSL	Semi-major axis--- 6377397.155 m. Semi-minor axis--- 6356078.9628 m. E^2 ----- .006674372
Army Map Service	AMS	Semi-major axis--- 6378270.0 m. Semi-minor axis--- 6356794.3434 m. E^2 ----- .006722670

III-66

TOP SECRET

25X1

TOP SECRET

25X

**MEASURING GRID
COORDINATES**

Mount the film positive, emulsion side up, on a light table. To measure the grid coordinates, place a Universal Grid Number 4-B over or under the frame so that the grid numbers read correctly. Align the grid so that

- * the $x = 0$ line is along the left format edge, and
- * the $y = 0$ line is along the bottom format edge

With a pinpoint or by some other method, mark the end points of the longest line segment (usually diagonal) that can be drawn through the target area. These end points must fall on grid intersections. Record the grid coordinates of these two points and note the order in which you recorded them. Cut the chip from the frame.

**INITIALIZING
A TELETYPE**

Before you can measure using the Real-Time Mensuration Program, the teletype must be initialized, that is, you must indicate to the program the type of photography to be processed and the camera system that produced the photography. To initialize a teletype follow these instructions in the order given.

Press & release	ALT MODE key
Press	CTRL & U keys (simultaneously)
Type	INIT
Press	RETURN key

You will then receive this message on the teletype:

ENTER SYSTEM NAME

III-67

TOP SECRET

25X1

TOP SECRET

25X1

Next,

Type	C4BR
Press	RETURN key

You will then receive this message:

LOAD CHIP

Load the film positive on the comparator. Procedures for placing the chips can be found in CHAPTER II, THE EQUIPMENT.

SUBMITTING
PARAMETERS

You will now receive a series of messages requesting parameters. Each message will consist of a request for a specific parameter and the format of that parameter. Characters used in the formats are these:

X = number
Z = letter
S = plus or minus sign
- = dash
. = decimal point

As you receive each message, type the requested parameter in the correct format and then press the RETURN key. You must press the RETURN key after you enter each parameter. For example, when you receive this message

PROJECT NUMBER XXXXXX

complete the message by typing the correct project number.

PROJECT NUMBER XXXXXX 111105

III-68

TOP SECRET

25X1

TOP SECRET

25X

Then press the RETURN key.

The program provides you with three methods for correcting errors. If you make an error(s) while submitting parameters, follow the appropriate set of instructions.

Correcting Characters

If the last character you typed was erroneous, you can correct it by using the upper case symbol on the N key (↑). Press the SHIFT key and the N key simultaneously. Pressing these keys will produce an arrow and delete the preceding character from the transmission. Then type the correct character. The incorrect character will remain on the printed page. For example:

ENTER SYSTEM NAME C4BT↑R

You can delete up to five consecutive characters. If you have more than one character to correct, press the SHIFT key and the N key to delete each one. Then type the correct characters.

Correcting Lines

If you have made an error in the preceding line, you can delete that line. Simply type DELET and then press the RETURN key. The preceding line, i.e., the parameter and its format, will be reprinted. Type the correct parameter and then press the RETURN key. For example,

ENTER SYSTEM NAME		C4BR	
LOAD FILM			
PROJECT NUMBER	XXXXXX	111052	
EMULSION	ZZ	DELET	RETURN key
PROJECT NUMBER	XXXXXX	111050	RETURN key
EMULSION	ZZ		

III-69

TOP SECRET

25X1

**TOP SECRET**

25X

You may delete as many lines as you wish. If you have more than one line to delete, type DELET and then press the RETURN key for each line. Each time you do this, the program will back up the parameter list one line. After you have deleted the last erroneous line and that parameter and its format have been reprinted, resume typing parameters.

For example,

ENTER SYSTEM NAME		C4BR	
LOAD FILM			
PROJECT NUMBER	XXXXXX	111052	
EMULSION	ZZ	UP	
MISSION	XXXX-X	DELET	RETURN key
EMULSION	ZZ	DELET	RETURN key
PROJECT NUMBER	XXXXXX	111050	RETURN key

Except for the first parameter, i.e., the system name, all parameters may be deleted using this method.

Correcting an Entire Parameter List

If you find that you have made several errors, you can delete the entire parameter list and begin again. To do this, type INIT and then press the RETURN key. The teletype will reprint ENTER SYSTEM NAME. Simply type the parameters again.

Terminating Frame Operations

At any time while you are submitting parameters, you may terminate frame operations. If you decide not to continue processing for any reason, simply type TERM and then press the RETURN key. The teletype will print TERM.

III-70

TOP SECRET

25X1

TOP SECRET

25X

**INITIALIZING
A COMPARATOR**

After you have submitted your parameters and the MPF retrieval has been successfully completed, you will receive one of the following two messages:

- * READY W S.R.-SEND FIRST FIDUCIAL
appears if stellar-derived attitude
of pan camera is available, or
- * READY W/O S.R.-SEND FIRST FIDUCIAL
appears if stellar-derived attitude
of pan camera is not available

Check the coordinate count on the control panel. The maximum permissible count is 999999. If the count is 900000 or over, reset the counter to 000000.

Before you can use a comparator to obtain dimensional data, it must be initialized, i.e., you must transmit the grid points to the program to establish a coordinate system. Using the X and Y drive and the X and Y wheels, place the comparator crosshairs over the point entered as the first grid. Transmit this point to the program by pressing the FIDUCIAL button. You will then receive the coordinates of this grid point on the teletype. You will also receive this message:

SEND NEXT FIDUCIAL

Position the crosshairs over the point entered as the second grid. Transmit this point to the program by pressing the FIDUCIAL button. You will receive the coordinates of the second grid point on the teletype. The direction of flight azimuth and the inertial azimuth will also be printed on the teletype. If they do not agree within a few degrees, there is an error in one of the parameters which was input from the teletype or in the retrieved information. You should locate the error and determine whether to continue or to start the program again. You will also receive this message:

VIEWER INITIALIZED

III-71

TOP SECRET

25X1

TOP SECRET

25X

**TRANSMITTING POINTS
FOR CALCULATIONS**

You are now ready to transmit points to be used for calculations by the Real-Time Mensuration Program. However, if you want the program to produce a plot, you must first initialize the plotter. (See CHAPTER II, INITIALIZING A PLOTTER section.) Then follow the instructions given below for transmitting points for calculations.

1. Turn the first rotary switch to the desired setting.
2. Release any output function buttons that may have been pressed.
3. Press the appropriate output function buttons for the calculations you want.
4. Position the comparator crosshairs over each point you want to transmit. Transmit each of these points to the program by pressing the appropriate transmission button.

Mensural calculations will be printed on the teletype. If you have elected to have the program produce a plot, you will also receive that on the plotter.

**TERMINATING FRAME
OPERATIONS**

After all measurements have been calculated, operations for the frame being processed must be terminated by pressing the FIDUCIAL button. Place the comparator crosshairs over the first grid point. Press the FIDUCIAL button to begin the termination of frame operations. You will then receive this message on the teletype:

FIRST TERMINAL FID RECEIVED

TOP SECRET

25X1

TOP SECRET

Measurements can continue to be calculated until you press the FIDUCIAL button twice in succession. When you press the FIDUCIAL button a second time, you will receive this message:

FRAME OPERATIONS TERMINATED DATE TIME
POINTING COUNT = XX FILM DRIFT = XX.XX MICRONS

The pointing count is the total number of points transmitted including grid points. Film drift is the distance the film has moved at the first grid point from the time the grid points were first transmitted until frame operations were terminated. Extensive film drift may result in inaccurate mensural calculations.

25X

SK4A, SK4B, SK4BR, SC4A, SC4B, AND SC4BR OPTIONS**OBTAINING
PARAMETERS**

Refer to this section under the monoscopic option that corresponds to the stereoscopic option you want to use. All the parameters needed to use a stereoscopic option will be found in the parameter table. However, those parameters listed in the table that fall between "Emulsion" and "Elevation" must be obtained for both frames or chips.

**CHOOSING
ELLIPSOIDS**

Refer to this section under the monoscopic option that corresponds to the stereoscopic option you want to use.

**MARKING FIDUCIALS OR
MEASURING GRID COORDINATES**

Refer to this section under the monoscopic option that corresponds to the stereoscopic option you want to use. The procedures for marking fiducials or measuring grid coordinates for a stereoscopic option are the same as those for a monoscopic option except that you must mark fiducials or measure grid coordinates for both frames or chips.

**INITIALIZING
A TELETYPE**

Refer to this section under the monoscopic option that corresponds to the stereoscopic option you want to use.

III-75

TOP SECRET

25X1

**TOP SECRET**

25X1

**SUBMITTING
PARAMETERS**

Refer to this section under the monoscopic option that corresponds to the stereoscopic option you want to use. The procedures for submitting parameters for a stereoscopic option are the same as those for a monoscopic option with the following exception. When using a stereoscopic option, the program will request some of the parameters twice. The first request will be for all the parameters for the left frame or chip and the second will be for the right frame or chip.

**INITIALIZING
A COMPARATOR**

Refer to this section under the monoscopic option that corresponds to the stereoscopic option you want to use. The procedures for initializing a comparator for a stereoscopic option are the same as those for a monoscopic option with the following exception. You must transmit fiducials or grid points for both frames or chips. Transmit the fiducials or grid points for the left frame or chip first.

**RELATIVE
ORIENTATION**

The relative orientation (R/O) of the frames or chips you are viewing with respect to each other should result in more accurate measurements. To calculate the relative orientation you must transmit from 6 to 20 corresponding points (R/O points) on each frame or chip simultaneously. These points must be as close as possible to the same ground elevation. Before transmitting the R/O points you must press the R/O output function button. The program is now ready to receive the R/O points.

III-76

TOP SECRET

25X1

TOP SECRET

25X

Transmitting
R/O Points

Move the crosshairs over the first R/O point to be transmitted. Send this point as an initial point. You will receive this message:

SEND NEXT POINT

Except for the last R/O point all R/O points must be sent as initial points. Each time you send an R/O point as an initial point, you will receive this message:

SEND NEXT POINT

Send the last R/O point as a terminal point. At this time an additional pitch, roll, and yaw will be calculated and printed on the teletype along with the following message:

PITCH = -OD 1M 20.9S
YAW = -OD 10M 22.9S
ROLL = +OD 5M 21.9S

RE-SET R/O SWITCH

Release the R/O button.

If you choose, you may have the coordinates of the R/O points printed on the teletype. To do this press the CMC ECHO button before you transmit the R/O points. Every time you send an R/O point as an initial point, you will receive this message:

SEND NEXT POINT

CMCX = XXXXX.X	MICRONS = XXXXXX COUNTS
CMCY = XXXXX.X	MICRONS = XXXXXX COUNTS
CMCX = XXXXX.X	MICRONS = XXXXXX COUNTS
CMCY = XXXXX.X	MICRONS = XXXXXX COUNTS

III-77

TOP SECRET

25X1

**TOP SECRET**

25X

When you transmit the terminal R/O point, you will receive this message:

PITCH = -0D 1M 20.9S
YAW = -0D 10M 22.9S
ROLL = +0D 5M 21.9S

RE-SET R/O SWITCH

CMCX = XXXXX.X	MICRONS = XXXXXX COUNTS
CMCY = XXXXX.X	MICRONS = XXXXXX COUNTS
CMCX = XXXXX.X	MICRONS = XXXXXX COUNTS
CMCY = XXXXX.X	MICRONS = XXXXXX COUNTS

Should you make an error while transmitting the R/O points, you can correct it by deleting the erroneous transmission. For example, if you send an incorrect R/O point as an initial point, you can delete that transmission by sending an intermediate point. You will receive this message:

LAST POINT DELETED

If you have transmitted several erroneous initial points, send the same number of intermediate points, and when the last intermediate point is received, you will receive this message:

ALL POINTS DELETED

After you have transmitted the R/O points and received the additional pitch, roll, and yaw, you are ready to transmit points for mensural calculations as described in the following section. However, if you find that the additional pitch, roll, and yaw do not result in more accurate calculations, you can nullify the relative orientation or recalculate it.

III-78

TOP SECRET

25X1

TOP SECRET

25X

Nullifying The
Relative Orientation

To nullify the relative orientation, release the R/O button and press the SET R/O TO IDENTITY button. Transmit a point for mensural calculations. You will receive the mensural output requested and this message:

R/O SET TO IDENTITY MATRIX

You are ready to continue transmitting points for mensural calculations without the additional pitch, roll, and yaw.

Recalculating The
Relative Orientation

To recalculate the relative orientation, first nullify it, and then recalculate the relative orientation according to the procedures described above.

TRANSMITTING POINTS
FOR CALCULATIONS

Refer to this section under the monoscopic option that corresponds to the stereoscopic option you are using.

SWITCHING FROM A STEREO
OPTION TO A MONO OPTION

When you are using a stereo comparator, you can switch to a monoscopic option for either the left or right stage and back to stereo without reinitializing the comparator by turning the second rotary switch in the first

III-79

TOP SECRET

25X1

TOP SECRET

25X

row of rotary switches to the setting which corresponds to the option you want. The second rotary switch settings and the options are:

<u>Second Rotary Switch Setting</u>	<u>Option</u>
Ø	Stereo
1	Mono - left stage
2	Mono - right stage

You must also turn the first rotary switch which indicates the output functions you will use to the desired setting. There are different settings for stereoscopic and monoscopic options. (See CHAPTER II, USING THE OUTPUT FUNCTION BUTTONS section.)

When switching from one option to another, the first point transmitted after turning the first and second rotary switches to the desired settings must be an initial point. After sending an initial point, you will receive one of the following messages which indicates which option has been selected prior to any printed output:

BOTH FRAMES - STEREO
RIGHT FRAME
LEFT FRAME

If the first point transmitted is other than an initial point, you will receive the following message:

ILLEGAL POINT SEQUENCE

If you receive this message, transmit the next point as an initial point.

TERMINATING FRAME
OPERATIONS

Refer to this section under the monoscopic option that corresponds to the stereoscopic option you are using.

CHAPTER IV. PROCESSING PHOTOGRAPHY FROM THE KH-7 CAMERA SYSTEM

Using the Real-Time Mensuration Program to process photography derived from the KH-7 camera system will involve these steps in the order listed.

- STEP 1 obtaining parameters
- STEP 2 choosing ellipsoids
- STEP 3 marking fiducials (or measuring grid coordinates)
- STEP 4 initializing a teletype
- STEP 5 submitting parameters
- STEP 6 initializing a comparator
- STEP 7 transmitting points for calculations
- STEP 8 terminating frame operations

There are several options under which you may process KH-7 photography. However, parameters for KH-7 missions are not included in the MPF, and there is no capability for using variable filmspeed. The options are these:

Monoscopic Options

- K7A frame of photography; average filmspeed
- C7A chip of photography; average filmspeed

IV-1

TOP SECRET

25X1

TOP SECRET

25X1

Stereoscopic Options

- SK7A two frames of stereo photography; average
 filmspeed
- SC7A two chips of stereo photography; average
 filmspeed

When using any of the stereoscopic options, two additional steps are available. They are:

- * transmitting relative orientation (R/O) points
to calculate the relative orientation of the
two frames or chips of photography
- * switching to the corresponding monoscopic op-
tion for either the left or right stage

Both of these steps are optional.

TOP SECRET

25X1

TOP SECRET

25X

K7A OPTION

**OBTAINING
PARAMETERS**

You will be responsible for obtaining all parameters needed for each use of the program. Parameters will identify the film being processed, and they will be transmitted via an on-line teletype. If you want the program to produce a plot, you will also need a parameter for plot distance. The use of this capability is optional.

Before you use the program, assemble all required parameters. These parameters and their sources are listed in Table 14. Most parameters can be found in the Mission Correlation Data (MCD) for the mission from which the film was derived. Many requests via the teletype for parameters will be followed by

* T1; indicating the value of that
parameter recorded at camera
"on" time

or

* T2; indicating the value of that
parameter recorded at camera "off"
time

Both of these values can be obtained from the MCD.

25X1

CHOOSING
ELLIPSOIDS

When evaluating film you will indicate the earth ellipsoid which best fits the target area. Choose the best fitting ellipsoid out of the six presently available and enter the mnemonic for that ellipsoid as a parameter. The six ellipsoids, their mnemonics, and their measurements including the eccentricity squared (E^2) of each ellipsoid are given below.

<u>Ellipsoid</u>	<u>Mnemonic</u>	<u>Measurement</u>
Mission Correlation Data or Mission Performance Report	MCD	Semi-major axis--- 6378177.8 m. Semi-minor axis--- 6356796.05 m. E^2 ----- .006693422
Krassovsky	KVY	Semi-major axis--- 6378245.0 m. Semi-minor axis--- 6356863.0188 m. E^2 ----- .006693422
International	INT	Semi-major axis--- 6378388.0 m. Semi-minor axis--- 6356911.9961 m. E^2 ----- .006722670
Clarke 1866	CRK	Semi-major axis--- 6378206.4 m. Semi-minor axis--- 6356583.8 m. E^2 ----- .006768658
Bessel	BSL	Semi-major axis--- 6377397.155 m. Semi-minor axis--- 6356078.9628 m. E^2 ----- .006674372
Army Map Service	AMS	Semi-major axis--- 6378270.0 m. Semi-minor axis--- 6356794.3434 m. E^2 ----- .006722670

25X

**DETERMINING PAYLOAD
CLOCK TIME**

When using this option the program requires the payload clock time (PCT) at time 1 and the PCT at time 2 as parameters. You can obtain this information from the MCD or read the PCT directly from the film. On a KH-7 time track payload clock time is represented by PCT "words" consisting of 23 binary digits or bits, i.e., 0 and 1.* (See Figure 16 which appears at the end of this chapter.) A twenty-fourth bit is assumed to be present and is considered to be OFF. The least significant bit in the PCT word is the index bit which is always ON. This bit is also one of the bits in the 20-cycle time track. Beginning with the least significant bit and moving to the left, divide the bits into groups of three binary digits. Convert each group of three bits to its corresponding octal number. Binary numbers and their octal equivalents are listed below.

<u>Binary Numbers</u>	<u>Corresponding Octal Numbers</u>
000	0
001	1
010	2
011	3
100	4
101	5
110	6
111	7

* Binary digit 0 is OFF; binary digit 1 is ON. The bits that are physically present on the time track are ON bits. The absence of a bit indicates an OFF bit.

TOP SECRET

**TOP SECRET**

25X

**MARKING
FIDUCIALS**

When using this option you have the choice of transmitting two or five fiducials. Transmitting five fiducials should result in more accurate mensural output.

Marking Two
Fiducials

Mount the film positive, emulsion side up, on a light table. The titling will be at the top of the frame, but it will not be in the correct reading position. Note the series of small, collinear time marks at the bottom of the film. This is a time track. With a grease pencil or by some other method, circle the time track at a point which is at least four inches from the left edge of the frame. This circle should be directly opposite the target area if possible. One of the time marks in this circle will be fiducial 1. Circle another area on the time track about two to four inches to the left of the first circle. One of the time marks in this circle will be fiducial 2. (See Figure 17 which appears at the end of this chapter.)

Marking Five
Fiducials

Mount the film positive, emulsion side up, on a light table. The titling will be at the top of the frame, but it will not be in the correct reading position. With a grease pencil or by some other method, circle the five fiducials on the film positive. Fiducial 1 is the index bit of the PCT word closest to the target area (the reference PCT word). Fiducials 2 and 3 may be any points along the bottom edge of the imagery, but the position of fiducial 3 in relation to fiducial 2 must be in the direction of "time on." In other words, if an arrow were drawn from fiducial 3 to fiducial 2, it would indicate the direction of flight. Fiducials 4 and 5 may be in either order along the top edge of the imagery, but they must be the same distance from the longitudinal center line as fiducials 2 and 3. (See Figure 18 which appears at the end of this chapter.)

25X1

INITIALIZING
A TELETYPE

Before you can measure using the Real-Time Mensuration Program, the teletype must be initialized, that is, you must indicate to the program the type of photography to be processed and the camera system that produced that photography. To initialize a teletype follow these instructions in the order given.

Press & release	ALT MODE key
Press	CTRL + U keys (simultaneously)
Type	INIT
Press	RETURN key

You will then receive this message on the teletype:

ENTER SYSTEM NAME

Next,

Type	K7A
Press	RETURN key

You will then receive this message:

LOAD FILM

Load the film positive on a comparator. Procedures for mounting film on a comparator will depend on which comparator you use. These procedures can be found in CHAPTER II, THE EQUIPMENT.

IV-10

TOP SECRET

25X1

TOP SECRET

25X

SUBMITTING
PARAMETERS

You will now receive a series of messages requesting parameters. Each message will consist of a request for a specific parameter and the format of that parameter. Characters used in the formats are these:

X = number
Z = letter
S = plus or minus sign
- = dash
. = decimal point

As you receive each message, type the requested parameter in the correct format and then press the RETURN key. You must press the RETURN key after you enter each parameter. For example, when you receive this message

PROJECT NUMBER XXXXXX

complete the message by typing the correct project number.

PROJECT NUMBER XXXXXX 920022

Then press the RETURN key.

The program provides you with three methods for correcting errors. If you make an error(s) while submitting parameters, follow the appropriate set of instructions.

Correcting Characters

If the last character you typed was erroneous, you can correct it by using the upper case symbol on the N key (†). Press the SHIFT key and the N key simultaneously. Pressing these keys will produce an arrow and delete the preceding character from the transmission. Then

IV-11

TOP SECRET

25X1

TOP SECRET

25X

type the correct character. The incorrect character will remain on the printed page. For example:

ENTER SYSTEM NAME K7C+A

You can delete up to five consecutive characters. If you have more than one character to correct, press the SHIFT key and the N key to delete each one. Then type the correct characters.

Correcting Lines

If you have made an error in the preceding line, you can delete that line. Simply type DELET and then press the RETURN key. The preceding line, i.e., the parameter and its format, will be reprinted. Type the correct parameter and then press the RETURN key. For example,

ENTER SYSTEM NAME		K7A	
LOAD FILM			
PROJECT NUMBER	XXXXXX	920032	
EMULSION	ZZ	DELET	RETURN key
PROJECT NUMBER	XXXXXX	920022	RETURN key
EMULSION	ZZ		

You may delete as many lines as you wish. If you have more than one line to delete, type DELET and then press the RETURN key for each line. Each time you do this, the program will back up the parameter list one line. After you have deleted the last erroneous line and that parameter and its format have been reprinted, resume typing parameters. For example,

ENTER SYSTEM NAME		K7A	
LOAD FILM			
PROJECT NUMBER	XXXXXX	920032	
EMULSION	ZZ	DN	
FIDUCIALS	X	DELET	RETURN key
EMULSION	ZZ	DELET	RETURN key
PROJECT NUMBER	XXXXXX	920022	RETURN key
EMULSION	ZZ		

IV-12

TOP SECRET

25X1

TOP SECRET

25X

Except for the first parameter, i.e., the system name, all parameters may be deleted using this method.

Correcting an Entire
Parameter List

If you find that you have made several errors, you can delete the entire parameter list and begin again. To do this, type INIT and then press the RETURN key. The teletype will reprint ENTER SYSTEM NAME. Simply type the parameters again.

Terminating Frame
Operations

At any time while you are submitting parameters, you may terminate frame operations. If you decide not to continue processing for any reason, simply type TERM and then press the RETURN key. The teletype will print TERM.

INITIALIZING
A COMPARATOR

After you have submitted all parameters, this message will appear on the teletype you are using:

INITIALIZE VIEWER--SEND FIRST FIDUCIAL

Check the coordinate count on the control panel. The maximum permissible count is 999999. If the count is 900000 or over, reset the counter to 000000.

Before you can use a comparator to obtain dimensional data, it must be initialized, i.e., you must transmit fiducials to the program to establish a coordinate system. Whether you transmit two fiducials or five fiducials will depend on the number you input as a parameter.

IV-13

TOP SECRET

25X1

**TOP SECRET**

25X1

Transmitting
Two Fiducials

Using the X and Y drive and the X and Y wheels, place the crosshairs over the area circled earlier for fiducial 1. Select one of the time marks in the circle. For best results, place the crosshairs over a point on this time mark so that a corresponding point can be easily located on the time mark you select for fiducial 2. For example, select one corner of this time mark. Transmit this corner as fiducial 1 by pressing the FIDUCIAL button. You will receive the coordinates of fiducial 1 via the teletype. You will also receive this message:

SEND NEXT FIDUCIAL

Move the crosshairs to the other circled area and select a time mark. Position the crosshairs over the corner on this time mark that corresponds to the one selected for fiducial 1. Transmit this corner as fiducial 2 by pressing the FIDUCIAL button. You will receive the coordinates of fiducial 2 on the teletype. The direction of flight azimuth and the inertial azimuth will also be printed on the teletype. If they do not agree within a few degrees, there is an error in one of the parameters which was input from the teletype. You should locate the error and determine whether to continue or to start the program again. You will also receive this message:

VIEWER INITIALIZED

Transmitting
Five Fiducials

Using the X and Y drive and the X and Y wheels, move the crosshairs over the index bit of the PCT word closest to the target area (the reference PCT word) circled as fiducial 1. Transmit this point as fiducial 1 by pressing the FIDUCIAL button. You will receive the coordinates of fiducial 1 via the teletype. You will also receive this message:

SEND NEXT FIDUCIAL

IV-14

TOP SECRET

25X1

TOP SECRET

25X

Move the crosshairs to the point circled for fiducial 2. Transmit this point as fiducial 2 by pressing the FIDUCIAL button. Transmit fiducials 3, 4, and 5 in the same manner. After each fiducial is transmitted, you will receive its coordinates on the teletype, and except for fiducial 5, you will also receive this message:

SEND NEXT FIDUCIAL

After fiducial 5 has been transmitted, the direction of flight azimuth and the inertial azimuth will be printed on the teletype. If they do not agree within a few degrees, there is an error in one of the parameters which was input from the teletype. You should locate the error and determine whether to continue or to start the program again. You will also receive this message:

VIEWER INITIALIZED

**TRANSMITTING POINTS
FOR CALCULATIONS**

You are now ready to transmit points to be used for calculations by the Real-Time Mensuration Program. However, if you want the program to produce a plot, you must first initialize the plotter. (See CHAPTER II, INITIALIZING A PLOTTER section.) Then follow the instructions given below for transmitting points for calculations.

1. Turn the first rotary switch to the desired setting.
2. Release any output function buttons that may have been pressed.
3. Press the appropriate output function buttons for the calculations you want.
4. Position the comparator crosshairs over each point you want to transmit. Transmit each of these points to the program by pressing the appropriate transmission button.

IV-15

TOP SECRET

25X1

TOP SECRET

25X1

Mensural calculations will be printed on the teletype. If you have elected to have the program produce a plot, you will also receive that on the plotter.

25X1

TERMINATING FRAME
OPERATIONS

After all measurements have been calculated, operations for the frame being processed must be terminated by pressing the FIDUCIAL button. Place the comparator crosshairs over fiducial 1. Press the FIDUCIAL button to begin the termination of frame operations. You will then receive this message on the teletype:

FIRST TERMINAL FID RECEIVED

Measurements can continue to be calculated until you press the FIDUCIAL button twice in succession. When you press the FIDUCIAL button a second time, you will receive this message:

FRAME OPERATIONS TERMINATED DATE TIME
POINTING COUNT = XX FILM DRIFT = XX.XX MICRONS

The pointing count is the total number of points transmitted including fiducials. Film drift is the distance the film has moved at fiducial 1 from the time the fiducials were first transmitted until frame operations were terminated. Extensive film drift may result in inaccurate mensural calculations.

C7A OPTION**OBTAINING
PARAMETERS**

You will be responsible for obtaining all parameters needed for each use of the program. Parameters will identify the film being processed, and they will be transmitted via an on-line teletype. If you want the program to produce a plot, you will also need a parameter for plot distance. The use of this capability is optional.

Before you use the program, assemble all required parameters. These parameters and their sources are listed in Table 15. Most parameters can be found in the Mission Correlation Data (MCD) for the mission from which the film was derived. Many requests via the teletype for parameters will be followed by

* T1; indicating the value of that
parameter recorded at camera
"on" time

or

* T2; indicating the value of that
parameter recorded at camera "off"
time

Both of these values can be obtained from the MCD.

**DETERMINING PAYLOAD
CLOCK TIME**

When using this option the program requires the payload clock time (PCT) at time 1 and time 2 as parameters. You can obtain this information from the MCD or read the PCT directly from the film. Payload clock time is represented on a time track by PCT "words" consisting of binary digits or bits, i.e., 0 and 1.* On a KH-7 time track the PCT word consists of 23 bits. (See Figure 16 which appears at the end of this chapter.) A twenty-fourth bit is assumed to be present and is considered to be OFF. The least significant bit in the PCT word is the index bit which is always ON. This bit is also one of the bits in the 20-cycle time track. Beginning with the least significant bit, and moving to the left, divide the bits into groups of three binary digits. Convert each group of three bits to its corresponding octal number. Binary numbers and their octal equivalents are listed below.

<u>Binary Numbers</u>	<u>Corresponding Octal Numbers</u>
000	0
001	1
010	2
011	3
100	4
101	5
110	6
111	7

* Binary digit 0 is OFF; binary digit 1 is ON. The bits that are physically present on the time track are ON bits. The absence of a bit indicates an OFF bit.

TOP SECRET

25X1

TOP SECRET

25X

**MEASURING GRID
COORDINATES**

Mount the film positive, emulsion side down, on a light table. The titling will be at the top of the frame, and it will be in the correct reading position. To measure the grid coordinates, place a Universal Grid Number 1 over or under the film so that the grid numbers and grid titling read correctly. Position the grid so that

- * the $x = 46$ line is aligned with the index bit to the left of the target, and
- * the tick marks at $y = 23.1$ are aligned with the yaw slit line, which is a clear line imaged at the top of the frame approximately two millimeters from the format edge

With a pinpoint or by some other method, mark the end points of the longest line segment (usually diagonal) that can be drawn through the target area. These points must fall on grid intersections. Record the grid coordinates of these two points and note the order in which you recorded them. Cut the chip from the frame.

**INITIALIZING
A TELETYPE**

Before you can measure using the Real-Time Mensuration Program, the teletype must be initialized, that is, you must indicate to the program the type of photography to be processed and the camera system that produced the photography. To initialize a teletype follow these instructions in the order given.

TOP SECRET

25X1

TOP SECRET

25X1

Press & release	ALT MODE key
Press	CTRL + U keys (simultaneously)
Type	INIT
Press	RETURN key

You will then receive this message on the teletype:

ENTER SYSTEM NAME

Next,

Type	C7A
Press	RETURN key

You will then receive this message:

LOAD CHIP

Load the film positive on the comparator. Procedures for placing the chips can be found in CHAPTER II, THE EQUIPMENT.

SUBMITTING
PARAMETERS

You will now receive a series of messages requesting parameters. Each message will consist of a request for a specific parameter and the format of that parameter. Characters used in the formats are these:

IV-26

TOP SECRET

25X1

TOP SECRET

25X1

X = number
Z = letter
S = plus or minus sign
- = dash
. = decimal point

As you receive each message, type the requested parameter in the correct format and then press the RETURN key. You must press the RETURN key after you enter each parameter. For example, when you receive this message

PROJECT NUMBER XXXXXX

complete the message by typing the correct project number.

PROJECT NUMBER XXXXXX 920022

Then press the RETURN key.

The program provides you with three methods for correcting errors. If you make an error(s) while submitting parameters, follow the appropriate set of instructions.

Correcting Characters

If the last character you typed was erroneous, you can correct it by using the upper case symbol on the N key (†). Press the SHIFT key and the N key simultaneously. Pressing these keys will produce an arrow and delete the preceding character from the transmission. Then type the correct character. The incorrect character will remain on the printed page. For example:

ENTER SYSTEM NAME C7C†A

IV-27

TOP SECRET

25X1

TOP SECRET

25X

You can delete up to five consecutive characters. If you have more than one character to correct, press the SHIFT key and the N key to delete each one. Then type the correct characters.

Correcting Lines

If you have made an error in the preceding line, you can delete that line. Simply type DELET and then press the RETURN key. The preceding line, i.e., the parameter and its format, will be reprinted. Type the correct parameter and then press the RETURN key. For example,

ENTER SYSTEM NAME		C7A	
LOAD FILM			
PROJECT NUMBER	XXXXXX	920032	
EMULSION	ZZ	DELET	RETURN key
PROJECT NUMBER	XXXXXX	920022	RETURN key
EMULSION	ZZ		

You may delete as many lines as you wish. If you have more than one line to delete, type DELET and then press the RETURN key for each line. Each time you do this, the program will back up the parameter list one line. After you have deleted the last erroneous line and that parameter and its format have been reprinted, resume typing parameters. For example,

ENTER SYSTEM NAME		C7A	
LOAD FILM			
PROJECT NUMBER	XXXXXX	920032	
EMULSION	ZZ	DN	
MISSION	XXXX	DELET	RETURN key
EMULSION	ZZ	DELET	RETURN key
PROJECT NUMBER	XXXXXX	920022	RETURN key
EMULSION	ZZ		

Except for the first parameter, i.e., the system name, all parameters may be deleted using this method.

TOP SECRET

25X1

TOP SECRET

25X

Correcting an Entire
Parameter List

If you find that you have made several errors, you can delete the entire parameter list and begin again. To do this, type INIT and then press the RETURN key. The teletype will reprint ENTER SYSTEM NAME. Simply type the parameters again.

Terminating Frame
Operations

At any time while you are submitting parameters, you may terminate frame operations. If you decide not to continue processing for any reason, simply type TERM and then press the RETURN key. The teletype will print TERM.

INITIALIZING
A COMPARATOR

After you have submitted all parameters, this message will appear on the teletype you are using:

INITIALIZE VIEWER--SEND FIRST FIDUCIAL

Check the coordinate count on the control panel. The maximum permissible count is 999999. If the count is 900000 or over, reset the counter to 000000.

Before you can use a comparator to obtain dimensional data, it must be initialized, i.e., you must transmit grid points to the program to establish a coordinate system. Using the X and Y drive and the X and Y wheels, place the comparator crosshairs over the point entered as the first grid. Transmit this point to the program by pressing the FIDUCIAL

IV-29

TOP SECRET

25X1

**TOP SECRET**

25X

button. You will then receive the coordinates of this grid point on the teletype. You will also receive this message:

SEND NEXT FIDUCIAL

Position the crosshairs over the point entered as the second grid. Transmit this point to the program by pressing the FIDUCIAL button. You will receive the coordinates of the second grid point on the teletype. The direction of flight azimuth and the inertial azimuth will also be printed on the teletype. If they do not agree within a few degrees, there is an error in one of the parameters which was input from the teletype. You should locate the error and determine whether to continue or to start the program again. You will also receive this message:

VIEWER INITIALIZED

**TRANSMITTING POINTS
FOR CALCULATIONS**

You are now ready to transmit points to be used for calculations by the Real-Time Mensuration Program. However, if you want the program to produce a plot, you must first initialize the plotter. (See CHAPTER II, INITIALIZING A PLOTTER section.) Then follow the instructions given below for transmitting points for calculations.

1. Turn the first rotary switch to the desired setting.
2. Release any output function buttons that may have been pressed.
3. Press the appropriate output function buttons for the calculations you want.
4. Position the comparator crosshairs over each point you want to transmit. Transmit each of these points to the program by pressing the appropriate transmission button.

IV-30

TOP SECRET

25X1

TOP SECRET

25X

Mensural calculations will be printed on the teletype. If you have elected to have the program produce a plot, you will also receive that on the plotter.

**TERMINATING FRAME
OPERATIONS**

After all measurements have been calculated, operations for the frame being processed must be terminated by pressing the FIDUCIAL button. Place the comparator crosshairs over the first grid point. Press the FIDUCIAL button to begin the termination of frame operations. You will then receive this message on the teletype:

FIRST TERMINAL FID RECEIVED

Measurements can continue to be calculated until you press the FIDUCIAL button twice in succession. When you press the FIDUCIAL button a second time, you will receive this message:

FRAME OPERATIONS TERMINATED DATE TIME
POINTING COUNT = XX FILM DRIFT = XX.XX MICRONS

The pointing count is the total number of points transmitted including grid points. Film drift is the distance the film has moved at the first grid point from the time the grid points were first transmitted until frame operations were terminated. Extensive film drift may result in inaccurate mensural calculations.

SK7A AND SC7A OPTIONS

**OBTAINING
PARAMETERS**

Refer to this section under the monoscopic option that corresponds to the stereoscopic option you want to use. All the parameters needed to use a stereoscopic option will be found in the parameter table. However, those parameters listed in the table that fall between "Fiducials" and "Elevation" for the SK7A option and "Emulsion" and "Elevation" for the SC7A option must be obtained for both frames or chips.

**CHOOSING
ELLIPSOIDS**

Refer to this section under the monoscopic option that corresponds to the stereoscopic option you want to use.

**DETERMINING PAYLOAD
CLOCK TIME**

Refer to this section under the monoscopic option that corresponds to the stereoscopic option you want to use. The procedures for determining payload clock time for a stereoscopic option are the same as those for a monoscopic option except that you must determine the payload clock time for both frames or chips.

**MARKING FIDUCIALS OR
MEASURING GRID COORDINATES**

Refer to this section under the monoscopic option that corresponds to the stereoscopic option you want to use. The procedures for marking fiducials or measuring grid coordinates for a stereoscopic option are the same as those for a monoscopic option except that you must mark fiducials or measure grid coordinates for both frames or chips.

IV-34

TOP SECRET

25X1

TOP SECRET

25X1

**INITIALIZING
A TELETYPE**

Refer to this section under the monoscopic option that corresponds to the stereoscopic option you want to use.

**SUBMITTING
PARAMETERS**

Refer to this section under the monoscopic option that corresponds to the stereoscopic option you want to use. The procedures for submitting parameters for a stereoscopic option are the same as those for a monoscopic option with the following exception. When using a stereoscopic option, the program will request some of the parameters twice. The first request will be for all the parameters for the left frame or chip and the second will be for the right frame or chip.

**INITIALIZING
A COMPARATOR**

Refer to this section under the monoscopic option that corresponds to the stereoscopic option you want to use. The procedures for initializing a comparator for a stereoscopic option are the same as those for a monoscopic option with the following exception. You must transmit fiducials or grid points for both frames or chips. Transmit the fiducials or grid points for the left frame or chip first.

**RELATIVE
ORIENTATION**

The relative orientation (R/O) of the frames or chips you are viewing with respect to each other should result in more accurate measurements. To calculate the relative orientation you must transmit from 6 to 20 corresponding points (R/O points) on each frame or chip simultaneously. These points must be as close as possible to the same ground elevation. Before transmitting the R/O points you must press the R/O output function button. The program is now ready to receive the R/O points.

IV-35

TOP SECRET

25X1

**TOP SECRET**

25X

Transmitting
R/O Points

Move the crosshairs over the first R/O point to be transmitted. Send this point as an initial point. You will receive this message:

SEND NEXT POINT

Except for the last R/O point all R/O points must be sent as initial points. Each time you send an R/O point as an initial point, you will receive this message:

SEND NEXT POINT

Send the last R/O point as a terminal point. At this time an additional pitch, roll, and yaw will be calculated and printed on the teletype along with the following message:

PITCH = -0D 1M 20.9S
YAW = -0D 10M 22.9S
ROLL = +0D 5M 21.9S

RE-SET R/O SWITCH

Release the R/O button.

If you choose, you may have the coordinates of the R/O points printed on the teletype. To do this press the CMC ECHO button before you transmit the R/O points. Every time you send an R/O point as an initial point, you will receive this message:

SEND NEXT POINT

CMCX = XXXXX.X	MICRONS = XXXXXX COUNTS
CMCY = XXXXX.X	MICRONS = XXXXXX COUNTS
CMCX = XXXXX.X	MICRONS = XXXXXX COUNTS
CMCY = XXXXX.X	MICRONS = XXXXXX COUNTS

IV-36

TOP SECRET

25X1

TOP SECRET

25X1

When you transmit the terminal R/O point, you will receive this message:

PITCH = -0D 1M 20.9S
YAW = -0D 10M 22.9S
ROLL = +0D 5M 21.9S

RE-SET R/O SWITCH

CMCX = XXXXX.X	MICRONS = XXXXXX COUNTS
CMCY = XXXXX.X	MICRONS = XXXXXX COUNTS
CMCX = XXXXX.X	MICRONS = XXXXXX COUNTS
CMCY = XXXXX.X	MICRONS = XXXXXX COUNTS

Should you make an error while transmitting the R/O points, you can correct it by deleting the erroneous transmission. For example, if you send an incorrect R/O point as an initial point, you can delete that transmission by sending an intermediate point. You will receive this message:

LAST POINT DELETED

If you have transmitted several erroneous initial points, send the same number of intermediate points, and when the last intermediate point is received, you will receive this message:

ALL POINTS DELETED

After you have transmitted the R/O points and received the additional pitch, roll, and yaw, you are ready to transmit points for mensural calculations as described in the following section. However, if you find that the additional pitch, roll, and yaw do not result in more accurate calculations, you can nullify the relative orientation or recalculate it.

Nullifying The
Relative Orientation

To nullify the relative orientation, release the R/O button and press the SET R/O TO IDENTITY button. Transmit a point for mensural calculations.

IV-37

TOP SECRET

25X1

TOP SECRET

25X

You will receive the mensural output requested and this message:

R/O SET TO IDENTITY MATRIX

You are ready to continue transmitting points for mensural calculations without the additional pitch, roll, and yaw.

Recalculating The
Relative Orientation

To recalculate the relative orientation, first nullify it, and then recalculate the relative orientation according to the procedures described on the previous pages.

TRANSMITTING POINTS
FOR CALCULATIONS

Refer to this section under the monoscopic option that corresponds to the stereoscopic option you are using.

SWITCHING FROM A STEREO
OPTION TO A MONO OPTION

When you are using a stereo comparator, you can switch to a monoscopic option for either the left or right stage and back to stereo without reinitializing the comparator by turning the second rotary switch in the first row of rotary switches to the setting which corresponds to the option you want. The second rotary switch settings and the options are:

Second Rotary
Switch Setting

Option

Ø	Stereo
1	Mono - left stage
2	Mono - right stage

IV-38

TOP SECRET

25X1

TOP SECRET

25X

You must also turn the first rotary switch which indicates the output functions you will use to the desired setting. There are different settings for stereoscopic and monoscopic options. (See CHAPTER II, USING THE OUTPUT FUNCTION BUTTONS section.)

When switching from one option to another, the first point transmitted after turning the first and second rotary switches to the desired settings must be an initial point. After sending an initial point, you will receive one of the following messages which indicates which option has been selected prior to any printed output:

BOTH FRAMES - STEREO
RIGHT FRAME
LEFT FRAME

If the first point transmitted is other than an initial point, you will receive the following message:

ILLEGAL POINT SEQUENCE

If you receive this message, transmit the next point as an initial point.

TERMINATING FRAME
OPERATIONS

Refer to this section under the monoscopic option that corresponds to the stereoscopic option you are using.

CHAPTER VII. PROCESSING PANORAMIC PHOTOGRAPHY

Using the Real-Time Mensuration Program to process photography from any panoramic camera system involves these steps in the order listed.

- STEP 1 obtaining parameters
- STEP 2 choosing ellipsoids
- STEP 3 marking fiducials
- STEP 4 initializing a teletype
- STEP 5 submitting parameters
- STEP 6 initializing a comparator
- STEP 7 transmitting points for calculations
- STEP 8 terminating frame operations

There are two options under which panoramic photography may be processed. They are:

Monoscopic Option

PAN frame of photography derived from any panoramic camera system

VII-1

TOP SECRET

25X1

TOP SECRET

25X

Stereoscopic Option

SPAN two frames of photography derived from
any panoramic camera system

When using the SPAN option, two additional steps are available. They are:

- * transmitting relative orientation (R/O) points
to calculate the relative orientation of the
two frames of photography
- * switching to the PAN option for either the left
or right stage

Both of these steps are optional.

VII-2

TOP SECRET

25X1

TOP SECRET

25X1

PAN OPTION

OBTAINING
PARAMETERS

You will be responsible for obtaining all parameters needed for each use of the program. Parameters will identify the film you are processing, and they will be transmitted via an on-line teletype. If you want the program to produce a plot, you will also need a parameter for plot distance. The use of this capability is optional.

Before you use the program, assemble all required parameters. These parameters and some of their sources are listed in Table 27. Because of the wide range of photography that can be used with this option, all sources do not appear in the table. You must determine the best source where no source is provided.

VII-3

**MARKING
FIDUCIALS**

One method of marking fiducials is presented here; other methods can be found which are equally good. Mount the film positive, emulsion side up, on a light table. Place a Universal Grid Number 2 over or under the film so that

- * the X = 46 and Y = 12 grid intersection is aligned with the principal point of the film
- * the grid lines are parallel to the format edges of the film
- * the positive Y axis is in the direction of flight

With a pinpoint or by some other method, mark three points on the film at non-collinear grid intersections. Two to four inches between points is sufficient. These three points will be fiducials 1, 2, and 3, respectively.

Next,

- * subtract 46 from each X value
- * subtract 12 from each Y value
- * multiply each grid coordinate by ten to convert it from centimeters to millimeters

The resultant values will be used as parameters. (See Table 27.)

VII-8

TOP SECRET

25X1

**TOP SECRET**

INITIALIZING
A TELETYPE

Before you can measure using the Real-Time Mensuration Program, the teletype must be initialized, that is, you must indicate to the program the type of photography to be processed. To initialize a teletype follow these instructions in the order given.

Press & release	ALT MODE key
Press	CTRL + U keys (simultaneously)
Type	INIT
Press	RETURN key

You will then receive this message on the teletype:

ENTER SYSTEM NAME

Next,

Type	PAN
Press	RETURN key

You will then receive this message:

LOAD FILM

Load the film positive on the comparator. Procedures for mounting film on a comparator will depend on which comparator you use. These procedures can be found in CHAPTER II, THE EQUIPMENT.

VII-9

**TOP SECRET**

25X1

**TOP SECRET**

25X1

**SUBMITTING
PARAMETERS**

You will now receive a series of messages requesting parameters. Each message will consist of a request for a specific parameter and the format of that parameter. Characters used in the formats are these:

X = number
Z = letter
S = plus or minus sign
- = dash
. = decimal point

As you receive each message, type the requested parameter in the correct format and then press the RETURN key. You must press the RETURN key after you enter each parameter. For example, when you receive this message

PROJECT NUMBER XXXXXX

complete the message by typing the correct project number.

PROJECT NUMBER XXXXXX 920022

Then press the RETURN key.

The program provides you with three methods for correcting errors. If you make an error(s) while submitting parameters, follow the appropriate set of instructions.

Correcting Characters

If the last character you typed was erroneous, you can correct it by using the upper case symbol on the N key (†). Press the SHIFT key and the N key simultaneously. Pressing these keys will produce an arrow and delete the preceding character from the transmission. Then type the

VII-10

TOP SECRET

25X1

TOP SECRET

25X

correct character. The incorrect character will remain on the printed page. For example:

ENTER SYSTEM NAME PAM↑N

You can delete up to five consecutive characters. If you have more than one character to correct, press the SHIFT key and the N key to delete each one. Then type the correct characters.

Correcting Lines

If you have made an error in the preceding line, you can delete that line. Simply type DELET and then press the RETURN key. The preceding line, i.e., the parameter and its format, will be reprinted. Type the correct parameter and then press the RETURN key. For example,

ENTER SYSTEM NAME		PAN	
LOAD FILM			
PROJECT NUMBER	XXXXXX	920032	
EMULSION	ZZ	DELET	RETURN key
PROJECT NUMBER	XXXXXX	920022	RETURN key
EMULSION	ZZ		

You may delete as many lines as you wish. If you have more than one line to delete, type DELET and then press the RETURN key for each line. Each time you do this, the program will back up the parameter list one line. After you have deleted the last erroneous line and that parameter and its format have been reprinted, resume typing parameters.

VII-11

TOP SECRET

25X1

TOP SECRET

25X1

For example,

ENTER SYSTEM NAME		PAN	
LOAD FILM			
PROJECT NUMBER	XXXXXX	920032	
EMULSION	ZZ	DN	
FOCAL LENGTH	XXXX.XXX	DELET	RETURN key
EMULSION	ZZ	DELET	RETURN key
PROJECT NUMBER	XXXXXX	920022	RETURN key
EMULSION	ZZ		

Except for the first parameter, i.e., the system name, all parameters may be deleted using this method.

Correcting An Entire Parameter List

If you find that you have made several errors, you can delete the entire parameter list and begin again. To do this, type INIT and then press the RETURN key. The teletype will reprint ENTER SYSTEM NAME. Simply type the parameters again.

Terminating Frame Operations

At any time while you are submitting parameters, you may terminate frame operations. If you decide not to continue processing for any reason, simply type TERM and then press the RETURN key. The teletype will print TERM.

VII-12

TOP SECRET

25X1

**TOP SECRET**

25X

INITIALIZING
A COMPARATOR

After you have submitted all parameters, this message will appear on the teletype:

INITIALIZE VIEWER--SEND FIRST FIDUCIAL

Check the coordinate count on the control panel. The maximum permissible count is 999999. If the count is 900000 or over, reset the counter to 000000.

Before you can use a comparator to obtain dimensional data, it must be initialized, i.e., you must transmit fiducials to the program to establish a coordinate system. Using the X and Y drive and the X and Y wheels, place the crosshairs over the point marked earlier as fiducial 1. Transmit fiducial 1 to the program by pressing the FIDUCIAL button. You will receive the comparator coordinates of fiducial 1 and this message:

SEND NEXT FID

Place the crosshairs over fiducial 2. Transmit fiducial 2 to the program by pressing the FIDUCIAL button. You will receive the comparator coordinates of fiducial 2 and this message:

SEND NEXT FID

Place the crosshairs over fiducial 3. Transmit fiducial 3 to the program by pressing the FIDUCIAL button. You will receive the comparator coordinates of fiducial 3 on the teletype. The direction of flight azimuth and the inertial azimuth will also be printed on the teletype. If they do not agree within a few degrees, there is an error in one of the parameters which was input from the teletype. You should locate the error and determine whether to continue or to start the program again. You will also receive this message:

VIEWER INITIALIZED

VII-13

TOP SECRET

25X1

**TOP SECRET**

25X1

**TRANSMITTING POINTS
FOR CALCULATIONS**

You are now ready to transmit points to be used for calculations by the Real-Time Mensuration Program. However, if you want the program to produce a plot, you must first initialize the plotter. (See CHAPTER II, INITIALIZING A PLOTTER section.) Then follow the instructions given below for transmitting points for calculations.

1. Turn the first rotary switch to the desired setting.
2. Release any output function buttons that may have been pressed.
3. Press the appropriate output function buttons for the calculations you want.
4. Position the comparator crosshairs over each point you want to transmit. Transmit each of these points to the program by pressing the appropriate transmission button.

25X1

Mensural calculations will be printed on the teletype. If you have elected to have the program produce a plot, you will also receive that on the  plotter.

**TERMINATING FRAME
OPERATIONS**

After all measurements have been calculated, operations for the frame being processed must be terminated by pressing the FIDUCIAL button. Place the comparator crosshairs over fiducial 1. Press the FIDUCIAL button to begin the termination of frame operations. You will then receive this message on the teletype:

FIRST TERMINAL FID RECEIVED

VII-14

TOP SECRET

25X1

TOP SECRET

25X

Measurements can continue to be calculated until you press the FIDUCIAL button twice in succession. When you press the FIDUCIAL button a second time, you will receive this message:

FRAME OPERATIONS TERMINATED DATE TIME
 POINTING COUNT = XX FILM DRIFT = XX.XX MICRONS

The pointing count is the total number of points transmitted including fiducials. Film drift is the distance the film has moved at fiducial 1 from the time the fiducials were first transmitted until frame operations were terminated. Extensive film drift may result in inaccurate mensural calculations.

SPAN OPTION

**OBTAINING
PARAMETERS**

Refer to this section under PAN OPTION. All the parameters needed to use the SPAN option will be found in the parameter table. However, those parameters listed in the table that fall between "Emulsion" and "Elevation" must be obtained for both frames.

**CHOOSING
ELLIPSOIDS**

Refer to this section under PAN OPTION.

**MARKING
FIDUCIALS**

Refer to this section under PAN OPTION. The procedures for marking fiducials for the SPAN option are the same except that you must mark fiducials for both frames.

**INITIALIZING
A TELETYPE**

Refer to this section under PAN OPTION.

VII-17

TOP SECRET

25X1

**TOP SECRET**

25X1

**SUBMITTING
PARAMETERS**

Refer to this section under PAN OPTION. The procedures for submitting parameters for the SPAN option are the same with the following exception. When using this option, the program will request some of the parameters twice. The first request will be for all the parameters for the left frame and the second will be for the right frame.

**INITIALIZING
A COMPARATOR**

Refer to this section under PAN OPTION. The procedures for initializing a comparator for the SPAN option are the same with the following exception. You must transmit fiducials for both frames. Transmit the fiducials for the left frame first.

**RELATIVE
ORIENTATION**

The relative orientation (R/O) of the frames you are viewing with respect to each other should result in more accurate measurements. To calculate the relative orientation you must transmit from 6 to 20 corresponding points (R/O points) on each frame simultaneously. These points must be as close as possible to the same ground elevation. Before transmitting the R/O points you must press the R/O output function button. The program is now ready to receive the R/O points.

**Transmitting
R/O points**

Move the crosshairs over the first R/O point to be transmitted. Send this point as an initial point. You will receive this message:

SEND NEXT POINT

VII-18

TOP SECRET

25X1

TOP SECRET

25X

Except for the last R/O point all R/O points must be sent as initial points. Each time you send an R/O point as an initial point, you will receive this message:

SEND NEXT POINT

Send the last R/O point as a terminal point. At this time an additional pitch, roll, and yaw will be calculated and printed on the teletype along with the following message:

PITCH = -0D 1M 20.9S

YAW = -0D 10M 22.9S

ROLL = +0D 5M 21.9S

RE-SET R/O SWITCH

Release the R/O button.

If you choose, you may have the coordinates of the R/O points printed on the teletype. To do this press the CMC ECHO button before you transmit the R/O points. Every time you send an R/O point as an initial point, you will receive this message:

SEND NEXT POINT

CMCX = XXXXX.X	MICRONS = XXXXXX COUNTS
CMCY = XXXXX.X	MICRONS = XXXXXX COUNTS
CMCX = XXXXX.X	MICRONS = XXXXXX COUNTS
CMCY = XXXXX.X	MICRONS = XXXXXX COUNTS

When you transmit the terminal R/O point, you will receive this message:

PITCH = -0D 1M 20.9S

YAW = -0D 10M 22.9S

ROLL = +0D 5M 21.9S

RE-SET R/O SWITCH

VII-19

TOP SECRET

25X1

**TOP SECRET**

25X1

CMCX = XXXXX.X	MICRONS = XXXXXX COUNTS
CMCY = XXXXX.X	MICRONS = XXXXXX COUNTS
CMCX = XXXXX.X	MICRONS = XXXXXX COUNTS
CMCY = XXXXX.X	MICRONS = XXXXXX COUNTS

Should you make an error while transmitting the R/O points, you can correct it by deleting the erroneous transmission. For example, if you send an incorrect R/O point as an initial point, you can delete that transmission by sending an intermediate point. You will receive this message:

LAST POINT DELETED

If you have transmitted several erroneous initial points, send the same number of intermediate points, and when the last intermediate point is received, you will receive this message:

ALL POINTS DELETED

After you have transmitted the R/O points and received the additional pitch, roll, and yaw, you are ready to transmit points for mensural calculations as described in the following section. However, if you find that the additional pitch, roll, and yaw do not result in more accurate calculations, you can nullify the relative orientation or recalculate it.

Nullifying The Relative Orientation

To nullify the relative orientation, release the R/O button and press the SET R/O TO IDENTITY button. Transmit a point for mensural calculations. You will receive the mensural output requested and this message:

R/O SET TO IDENTITY MATRIX

You are ready to continue transmitting points for mensural calculations without the additional pitch, roll, and yaw.

VII-20

TOP SECRET

25X1

TOP SECRET

25X

Recalculating The
Relative Orientation

To recalculate the relative orientation, first nullify it, and then recalculate the relative orientation according to the procedures described on the previous pages.

TRANSMITTING POINTS
FOR CALCULATIONS

Refer to this section under PAN OPTION.

SWITCHING FROM A STEREO
OPTION TO A MONO OPTION

When you are using a stereo comparator, you can switch to a monoscopic option for either the left or right stage and back to stereo without reinitializing the comparator by turning the second rotary switch in the first row of rotary switches to the setting which corresponds to the option you want. The second rotary switch settings and the options are:

<u>Second Rotary Switch Setting</u>	<u>Option</u>
Ø	Stereo
1	Mono - left stage
2	Mono - right stage

You must also turn the first rotary switch which indicates the output functions you will use to the desired setting. There are different settings for stereoscopic and monoscopic options. (See CHAPTER II, USING THE OUTPUT FUNCTION BUTTONS section.)

When switching from one option to another, the first point transmitted after turning the first and second rotary switches to the desired settings must be an initial point. After sending an initial point, you will receive

VII-21

TOP SECRET

25X1

TOP SECRET

25X1

one of the following messages which indicates which option has been selected prior to any printed output:

BOTH FRAMES - STEREO
RIGHT FRAME
LEFT FRAME

If the first point transmitted is other than an initial point, you will receive the following message:

ILLEGAL POINT SEQUENCE

If you receive this message, transmit the next point as an initial point.

TERMINATING FRAME
OPERATIONS

Refer to this section under PAN OPTION.

CHAPTER VIII. PROCESSING FRAME PHOTOGRAPHY

Using the Real-Time Mensuration Program to process photography from any frame camera system involves these steps in the order listed.

- STEP 1 obtaining parameters
- STEP 2 choosing ellipsoids
- STEP 3 marking fiducials
- STEP 4 initializing a teletype
- STEP 5 submitting parameters
- STEP 6 initializing a comparator
- STEP 7 transmitting points for calculations
- STEP 8 terminating frame operations

There are two options under which FRAME photography may be processed.
They are:

Monoscopic Option

FRAME frame of photography derived from any
frame camera system

VIII-1

TOP SECRET

25X1

TOP SECRET

25X

Stereoscopic Option

SFRAME two frames of photography derived from
any frame camera system

When using the SFRAME option, two additional steps are available. They are:

- * transmitting relative orientation (R/O) points
to calculate the relative orientation of the
two frames of photography
- * switching to the FRAME option for either the left
or right stage

Both of these steps are optional.

VIII-2

TOP SECRET

25X1

TOP SECRET

25X

FRAME OPTION

OBTAINING
PARAMETERS

You will be responsible for obtaining all parameters needed for each use of the program. Parameters will identify the film you are processing, and they will be transmitted via an on-line teletype. If you want the program to produce a plot, you will also need a parameter for plot distance. The use of this capability is optional.

Before you use the program, assemble all required parameters. These parameters and some of their sources are listed in Table 28. Because of the wide range of photography that can be used with this option, all sources do not appear in the table. You must determine the best source where no source is provided.

VIII-6

TOP SECRET

25X1

TOP SECRET
**MARKING
FIDUCIALS**

One method of marking fiducials is presented here; other methods, which are equally good, can also be used. Mount the film positive, emulsion side up, on a light table. Place a Universal Grid Number 2 over or under the film so that

- * the $X = 46$ and $Y = 12$ grid intersection is aligned with the principal point of the film
- * the grid lines are parallel to the format edges of the film
- * the positive Y axis is in the direction of flight

With a pinpoint or by some other method, mark three points on the film at non-collinear grid intersections. Two to four inches between points is sufficient. These three points will be fiducials 1, 2, and 3, respectively. Next,

- * subtract 46 from each X value
- * subtract 12 from each Y value
- * multiply each grid coordinate by ten to convert it from centimeters to millimeters

The resultant values will be used as parameters. (See Table 28.)

**INITIALIZING
A TELETYPE**

Before you can measure using the Real-Time Mensuration Program, the teletype must be initialized, that is, you must indicate to the program

VIII-7

TOP SECRET

TOP SECRET

25X1

the type of photography to be processed. To initialize a teletype follow these instructions in the order given.

Press & release	ALT MODE key
Press	CTRL + U keys (simultaneously)
Type	INIT
Press	RETURN key

You will then receive this message on the teletype:

ENTER SYSTEM NAME

Next,

Type	FRAME
Press	RETURN key

You will then receive this message:

LOAD FILM

Load the film positive on the comparator. Procedures for mounting film on a comparator will depend on which comparator you use. These procedures can be found in CHAPTER II, THE EQUIPMENT.

SUBMITTING
PARAMETERS

You will now receive a series of messages requesting parameters. Each message will consist of a request for a specific parameter and the format

VIII-8

TOP SECRET

25X1

TOP SECRET

25X

of that parameter. Characters used in the formats are these:

X = number
Z = letter
S = plus or minus sign
- = dash
. = decimal point

As you receive each message, type the requested parameter in the correct format and then press the RETURN key. You must press the RETURN key after you enter each parameter. For example, when you receive this message

PROJECT NUMBER XXXXXX

complete the message by typing the correct project number.

PROJECT NUMBER XXXXXX 920022

Then press the RETURN key.

The program provides you with three methods for correcting errors. If you make an error(s) while submitting parameters, follow the appropriate set of instructions.

Correcting Characters

If the last character you typed was erroneous, you can correct it by using the upper case symbol on the N key (†). Press the SHIFT key and the N key simultaneously. Pressing these keys will produce an arrow and delete the preceding character from the transmission. Then type the correct character. The incorrect character will remain on the printed page. For example:

ENTER SYSTEM NAME FRAMR†E

VIII-9

TOP SECRET

25X1

TOP SECRET

25X

You can delete up to five consecutive characters. If you have more than one character to correct, press the SHIFT key and the N key to delete each one. Then type the correct characters.

Correcting Lines

If you have made an error in the preceding line, you can delete that line. Simply type DELET and then press the RETURN key. The preceding line, i.e., the parameter and its format, will be reprinted. Type the correct parameter and then press the RETURN key. For example,

ENTER SYSTEM NAME		FRAME	
LOAD FILM			
PROJECT NUMBER	XXXXXX	920032	
EMULSION	ZZ	DELET	RETURN key
PROJECT NUMBER	XXXXXX	920022	RETURN key
EMULSION	ZZ		

You may delete as many lines as you wish. If you have more than one line to delete, type DELET and then press the RETURN key for each line. Each time you do this, the program will back up the parameter list one line. After you have deleted the last erroneous line and that parameter and its format have been reprinted, resume typing parameters. For example,

ENTER SYSTEM NAME		FRAME	
LOAD FILM			
PROJECT NUMBER	XXXXXX	920032	
EMULSION	ZZ	DN	
FOCAL LENGTH	XXXX.XXX	DELET	RETURN key
EMULSION	ZZ	DELET	RETURN key
PROJECT NUMBER	XXXXXX	920022	RETURN key
EMULSION	ZZ		

Except for the first parameter, i.e., the system name, all parameters may be deleted using this method.

VIII-10

TOP SECRET

25X1

TOP SECRET

25X

Correcting An Entire
Parameter List

If you find that you have made several errors, you can delete the entire parameter list and begin again. To do this, type INIT and then press the RETURN key. The teletype will reprint ENTER SYSTEM NAME. Simply type the parameters again.

Terminating Frame
Operations

At any time while you are submitting parameters, you may terminate frame operations. If you decide not to continue processing for any reason, simply type TERM and then press the RETURN key. The teletype will print TERM.

INITIALIZING
A COMPARATOR

After you have submitted all parameters, this message will appear on the teletype:

INITIALIZE VIEWER--SEND FIRST FIDUCIAL

Check the coordinate count on the control panel. The maximum permissible count is 999999. If the count is 999999 or over, reset the counter to 000000.

Before you can use a comparator to obtain dimensional data, it must be initialized, i.e., you must transmit fiducials to the program to establish a coordinate system. Using the X and Y drive and the X and Y wheels, place the crosshairs over the point marked earlier as fiducial 1. Transmit fiducial 1 to the program by pressing the FIDUCIAL button. You will receive the comparator coordinates of fiducial 1 and this message:

SEND NEXT FID

VIII-11

TOP SECRET

25X1

**TOP SECRET**

25X

Place the crosshairs over fiducial 2. Transmit fiducial 2 to the program by pressing the FIDUCIAL button. You will receive the comparator coordinates of fiducial 2 and this message:

SEND NEXT FID

Place the crosshairs over fiducial 3. Transmit fiducial 3 to the program by pressing the FIDUCIAL button. You will receive the comparator coordinates of fiducial 3. The direction of flight azimuth and the inertial azimuth will also be printed on the teletype. If they do not agree within a few degrees, there is an error in one of the parameters which was input from the teletype. You should locate the error and determine whether to continue or to start the program again. You will also receive this message:

VIEWER INITIALIZED

TRANSMITTING POINTS FOR CALCULATIONS

You are now ready to transmit points to be used for calculations by the Real-Time Mensuration Program. However, if you want the program to produce a plot, you must first initialize the plotter. (See CHAPTER II, INITIALIZING A PLOTTER section.) Then follow the instructions given below for transmitting points for calculations.

1. Turn the first rotary switch to the desired setting.
2. Release any output function buttons that may have been pressed.
3. Press the appropriate output function buttons for the calculations you want.
4. Position the comparator crosshairs over each point you want to transmit. Transmit each of these points to the program by pressing the appropriate transmission button.

VIII-12

TOP SECRET

25X1

TOP SECRET

25X

Mensural calculations will be printed on the teletype. If you have elected to have the program produce a plot, you will also receive that on the plotter.

**TERMINATING FRAME
OPERATIONS**

After all measurements have been calculated, operations for the frame being processed must be terminated by pressing the FIDUCIAL button. Place the comparator crosshairs over fiducial 1. Press the FIDUCIAL button to begin the termination of frame operations. You will then receive this message on the teletype:

FIRST TERMINAL FID RECEIVED

Measurements can continue to be calculated until you press the FIDUCIAL button twice in succession. When you press the FIDUCIAL button a second time, you will receive this message:

FRAME OPERATIONS TERMINATED DATE TIME
POINTING COUNT = XX FILM DRIFT = XX.XX MICRONS

The pointing count is the total number of points transmitted including fiducials. Film drift is the distance the film has moved at fiducial 1 from the time the fiducials were first transmitted until frame operations were terminated. Extensive film drift may result in inaccurate mensural calculations.

SFRAME OPTION

OBTAINING
PARAMETERS

Refer to this section under FRAME OPTION. All the parameters needed to use the SFRAME option will be found in the parameter table. However, those parameters listed in the table that fall between "Emulsion" and "Elevation" must be obtained for both frames.

CHOOSING
ELLIPSOIDS

Refer to this section under FRAME OPTION.

MARKING
FIDUCIALS

Refer to this section under FRAME OPTION. The procedures for marking fiducials for the SFRAME option are the same except that you must mark fiducials for both frames.

INITIALIZING
A TELETYPE

Refer to this section under FRAME OPTION.

VIII-15

TOP SECRET

25X1

**TOP SECRET**

25X

**SUBMITTING
PARAMETERS**

Refer to this section under FRAME OPTION. The procedures for submitting parameters for the SFRAME option are the same with the following exception. When using this option, the program will request some of the parameters twice. The first request will be for all the parameters for the left frame and the second will be for the right frame.

**INITIALIZING
A COMPARATOR**

Refer to this section under FRAME OPTION. The procedures for initializing a comparator for the SFRAME option are the same with the following exception. You must transmit fiducials for both frames. Transmit the fiducials for the left frame first.

**RELATIVE
ORIENTATION**

The relative orientation (R/O) of the frames you are viewing with respect to each other should result in more accurate measurements. To calculate the relative orientation you must transmit from 6 to 20 corresponding points (R/O points) on each frame simultaneously. These points must be as close as possible to the same ground elevation. Before transmitting the R/O points you must press the R/O output function button. The program is now ready to receive the R/O points.

**Transmitting
R/O Points**

Move the crosshairs over the first R/O point to be transmitted. Send this point as an initial point. You will receive this message:

SEND NEXT POINT

VIII-16

TOP SECRET

25X1

TOP SECRET

25X

Except for the last R/O point all R/O points must be sent as initial points. Each time you send an R/O point as an initial point, you will receive this message:

SEND NEXT POINT

Send the last R/O point as a terminal point. At this time an additional pitch, roll, and yaw will be calculated and printed on the teletype along with the following message:

PITCH = -0D 1M 20.9S
 YAW = -0D 10M 22.9S
 ROLL = +0D 5M 21.9S

RE-SET R/O SWITCH

Release the R/O button.

If you choose, you may have the coordinates of the R/O points printed on the teletype. To do this press the CMC ECHO button before you transmit the R/O points. Every time you send an R/O point as an initial point, you will receive this message:

SEND NEXT POINT

CMCX = XXXXX.X	MICRONS = XXXXXX COUNTS
CMCY = XXXXX.X	MICRONS = XXXXXX COUNTS
CMCX = XXXXX.X	MICRONS = XXXXXX COUNTS
CMCY = XXXXX.X	MICRONS = XXXXXX COUNTS

When you transmit the terminal R/O point, you will receive this message:

PITCH = -0D 1M 20.9S
 YAW = -0D 10M 22.9S
 ROLL = +0D 5M 21.9S

RE-SET R/O SWITCH

VIII-17

TOP SECRET

25X1

TOP SECRET

25X

CMCX = XXXXX.X	MICRONS = XXXXXX COUNTS
CMCY = XXXXX.X	MICRONS = XXXXXX COUNTS
CMCX = XXXXX.X	MICRONS = XXXXXX COUNTS
CMCY = XXXXX.X	MICRONS = XXXXXX COUNTS

Should you make an error while transmitting the R/O points, you can correct it by deleting the erroneous transmission. For example, if you send an incorrect R/O point as an initial point, you can delete that transmission by sending an intermediate point. You will receive this message:

LAST POINT DELETED

If you have transmitted several erroneous initial points, send the same number of intermediate points, and when the last intermediate point is received, you will receive this message:

ALL POINTS DELETED

After you have transmitted the R/O points and received the additional pitch, roll, and yaw, you are ready to transmit points for mensural calculations as described in the following section. However, if you find that the additional pitch, roll, and yaw do not result in more accurate calculations, you can nullify the relative orientation or recalculate it.

Nullifying The
Relative Orientation

To nullify the relative orientation, release the R/O button and press the SET R/O TO IDENTITY button. Transmit a point for mensural calculations. You will receive the mensural output requested and this message:

R/O SET TO IDENTITY MATRIX

You are ready to continue transmitting points for mensural calculations without the additional pitch, roll, and yaw.

VIII-18

TOP SECRET

25X1

TOP SECRET

25X

Recalculating The
Relative Orientation

To recalculate the relative orientation, first nullify it, and then recalculate the relative orientation according to the procedures described on the previous pages.

TRANSMITTING POINTS
FOR CALCULATIONS

Refer to this section under FRAME OPTION.

SWITCHING FROM A STEREO
OPTION TO A MONO OPTION

When you are using a stereo comparator, you can switch to a monoscopic option for either the left or right stage and back to stereo without reinitializing the comparator by turning the second rotary switch in the first row of rotary switches to the setting which corresponds to the option you want. The second rotary switch settings and the options are:

<u>Second Rotary Switch Setting</u>	<u>Option</u>
Ø	Stereo
1	Mono - left stage
2	Mono - right stage

You must also turn the first rotary switch which indicates the output functions you will use to the desired setting. There are different settings for stereoscopic and monoscopic options. (See CHAPTER II, USING THE OUTPUT FUNCTION BUTTONS section.)

When switching from one option to another, the first point transmitted after turning the first and second rotary switches to the desired settings must be an initial point. After sending an initial point, you will receive one of the following messages which indicates which option has been selected prior to any printed output:

VIII-19

TOP SECRET

25X1

TOP SECRET

25X

BOTH FRAMES - STEREO
 RIGHT FRAME
 LEFT FRAME

If the first point transmitted is other than an initial point, you will receive the following message:

ILLEGAL POINT SEQUENCE

If you receive this message, transmit the next point as an initial point.

TERMINATING FRAME
 OPERATIONS

Refer to this section under FRAME OPTION.

CHAPTER IX. TRANSMITTING SAMPLE POINTS FOR CALCULATIONS

Given a sample frame and the facilities that appear on that frame (Figure 25), assume that the required calculations for the sample are these:

Building A	length of sides; area; plot
Building B	geodetic coordinates; distance of three points from Building B; plot
Runway	length; azimuth; plot
Building C	relief height; width; length; plot
Railroad	azimuth (as it goes off the top of the frame)
	north arrow for plot

In Figure 25, the points are numbered in the order in which they may be transmitted for this sample. In addition, they are given alphabetic designators which denote the type of point to be transmitted. The designators used are I for initial, N for intermediate, T for terminal, and M for multiple. Instructions for transmitting the points to be used for calculations are given in Table 29.

CHAPTER X. ERROR MESSAGES

If an error of any type occurs, a message will be typed via the teletype. All of the error messages incorporated in the RTMP, their causes, and what to do if you receive one appear on the following pages. The messages are listed in alphabetical order.

X-1

TOP SECRET

25X1

E R R O R M E S S A G E S

(F=fiducial, I=initial, M=multiple, N=intermediate, T=terminal)

<u>Error Message</u>	<u>Cause</u>	<u>What To Do</u>
ALL POINTS DELETED	In variable filmspeed option or when using CIRCLE, CYLINDER, or R/O functions, transmitted N points deleted all I points required for determining measurements	Transmit I points again as specified in appropriate option or function; do not reinitialize teletype
AZIMUTH PT DIST ERROR	Point that is less than 6 in. from previous point transmitted to get azimuth	Transmit point that is at least 6 in. from previous point
BUSY	Communication lines to program operating at full capacity	No new request can be handled at this time; wait & then try to initialize teletype again
CHARACTER OVERFLOW	More than 10 characters entered for one parameter	Enter parameter in correct format; format is printed via teletype
CHIP MATH ERROR	Conversion error on Chip comparator	Notify SSB/AID

TOP SECRET

E R R O R M E S S A G E S (Continued)

<u>Error Message</u>	<u>Cause</u>	<u>What To Do</u>
CMCECHO IS IN ERROR	Conversion error	Check points transmitted & then transmit sequence again; if error persists, notify SSB/AID; continue transmitting points for other output
COMPUTATION ERROR	Program unable to calculate results of points transmitted	Check points transmitted & then transmit sequence again; if error persists, notify SSB/AID
DRUM READ ERROR	Problem encountered in attempt to read data from mass storage area	Notify SSB/AID
DRUM WRITE ERROR	Problem encountered in attempt to place data on mass storage area	Notify SSB/AID
ENTER FIDUCIAL	Points to be used for calculations transmitted before comparator initialization	Initialize comparator by sending fiducials

ILLEGAL PASS	MPF options only; pass (or revolution) number entered as parameter not part of mission indicated	Reinitialize teletype; enter correct mission, pass, & frame numbers <u>or</u> mission, revolution, & accession numbers
ILLEGAL PLT POINT	Point other than I transmitted for north arrow	Transmit I point for north arrow
ILLEGAL PLT POINT SEQUENCE	Point other than I transmitted for plotter initialization	If plot is desired, resend last point as I point If no plot is desired, release all plot output buttons
ILLEGAL POINT DESIGNATOR	Point designator other than F, I, N, T, or M received by program	Transmit last point again; if error persists, contact hardware maintenance personnel
ILLEGAL POINT SEQUENCE	Points transmitted out of sequence for desired output; e.g., a T point followed by an N when distance is desired output	Transmit points in correct sequence for desired output

25X1

ERROR MESSAGES (Continued)

<u>Error Message</u>	<u>Cause</u>	<u>What To Do</u>
VIEWER INITIALIZATION ERROR	Same point transmitted for both fiducials 1 & 2 during comparator initialization	Transmit correct fiducials; message can also be received purposely; i.e., if after transmitting fiducial 1 you realize it was erroneous, transmit the erroneous point a second time; you will receive this error message; then transmit correct fiducials
VIEWER IS LOCKED OUT	Attempt made to transmit points to be used for calculations before comparator initialization	Reinitialize teletype & initialize comparator

APPENDIX: S-AZIMUTH AND Z-AZIMUTH OUTPUT FUNCTIONS

The Real-Time Mensuration Program was modified to include two additional output functions after copy had already been prepared for the printer. Consequently, instructions for using the s-azimuth and the z-azimuth output functions are presented here rather than in CHAPTER II, Table 6, Output Function Buttons, and Table 7, Using Transmission and Output Function Buttons to Obtain Mensural Output.

There are no S-AZIMUTH and Z-AZIMUTH output function buttons as such. To use these functions, you must press the Q-AZIMUTH button.* When this button is pressed and an initial point transmitted to the Program, the q-azimuth, s-azimuth, and z-azimuth are printed on the teletype in the following format:

Q-AZIMUTH= XXX.XXX DEG
S-AZIMUTH= XXX.XXX DEG
Z-AZIMUTH= XXX.XXX DEG

**S-AZIMUTH OUTPUT
FUNCTION**

The s-azimuth is the theoretical azimuth from the base of an object to the end of its shadow. The procedures for calculating the s-azimuth and the mensural output for each step are presented on the next page.

* The q-azimuth output function is discussed in Tables 6 and 7.

TOP SECRET

25X1

TOP SECRET

25X

ProcedureMensural Output

Turn first rotary switch in top row of
rotary switches to Ø or 2

Press AZIMUTH, Q-AZIMUTH, & MI SHADOW
HEIGHT output function buttons

Transmit point at base of object as an
initial point

Q-azimuth, s-azimuth, &
z-azimuth

Release Q-AZIMUTH button

Transmit point at end of object's sha-
dow as terminal point

Azimuth & Ml shadow height

Compare the azimuth and the s-azimuth calculations. If they are not equal, then one or both of the points were transmitted inaccurately. You must determine if the accuracy you want will be satisfied with the discrepancy in azimuths. In general, you should attempt to achieve, the smallest difference possible between azimuths and check the Ml shadow height calculations with other height functions.

Z-AZIMUTH OUTPUT FUNCTION

The z-azimuth is the theoretical azimuth from the base of an object to the projection of the top of the object into the local horizontal plane. The procedures for calculating the z-azimuth and the mensural output for each step are given on the next page.
